Latin American Presidentialism in Comparative and Historical Perspective

José Antonio Cheibub,* Zachary Elkins,**
& Tom Ginsburg***

Since the time of Aristotle, comparative scholars have developed various alternative typologies to classify constitutional systems.[1] One paradigmatic scheme focuses on executive–legislative relations. Some systems,[2] we are told, are "presidential," in which a directly elected president serves a fixed term as both head of state and head of government. Others are "parliamentary," in which a legislative majority determines who will lead the government and for how long. A third model combines features of the two and is called "semi-presidential."[3]

Each of these models of "government type" has an archetype: The United States is seen as the quintessential presidential system,[4] the United Kingdom as the parliamentary model,[5] and France as the semi-presidential model.[6] The models are also seen as systemic, in that each implies a certain institutional configuration. So, presidential systems are thought to include a host of features (e.g., an executive veto) that are not typically found in

2. Patterns of executive–legislative relations are sometimes referred to as "forms" or "systems" of government. Scholars sometimes even summarize constitutions on the basis of these differences (e.g., labeling constitutions as either presidential or parliamentary), an indicator of the centrality of these features to constitutional structure more generally.

3. There is no consensus among scholars on the definition of forms of government, particularly with respect to semi-presidentialism. parliamentary systems.[7] In turn, heads of government in parliamentary systems are thought to be vested with powers that their counterparts in presidential systems do not have (e.g., decree power or legislative initiative).[8]

In a recent paper, we have argued that the conventional categories are *not* systemic in this sense.[9] Indeed, we found that stereotypes regarding presidentialism and parliamentarism are just that—stereotypes. When we looked at the distribution of several presumably systemic features, we found that only one of them could be described as a distinctive feature of one system or the other.[10] Our findings are captured by the following empirical insight from our analysis: *The century or region in which a constitution was written is a better predictor of institutional similarity (with respect to the studied features) than is its classification as presidential, parliamentary, or semi-presidential*.[11] The categories have a degree of internal cohesion, but not nearly as much as one would expect for categories that are thought to represent a fundamental and guiding set of choices for constitutional designers, especially given the tremendous scholarly literature built around them.[12]

One implication of this insight is that scholars need to explore alternative conceptualizations of executive–legislative relations. The distinction between assembly-confidence governments[13] and directly elected, fixed-term governments represents an important dimension—but only *one* dimension—in a clearly multidimensional conceptual space. In this Article, we explore this multidimensionality in the context of Latin America. Latin America provides a useful context for exploring variety within constitutional forms because of its monotypic history: since the emergence of the first independent states in the region early in the nineteenth century, the region has been dominated by the presidential model.[14] Indeed, of the former Spanish and Portuguese colonies in the Americas, the only country that adopted a lasting nonpresidential constitution was Brazil, from 1824 to 1891.[15] This apparent uniformity presents an opportunity to examine internal diversity within a single overarching category of presidential systems.

When we explore the architecture of executive–legislative relations in Latin America, it becomes clear that region matters as much as government type in predicting the distribution of constitutional provisions. Latin American presidentialism, while sharing a fair number of features with the U.S. archetype, is very much its own breed. What appears to distinguish the Latin American variety is a high degree of what we might summarize as executive lawmaking powers. Specifically, Latin American constitutions are uniquely inclined to empower presidents to decree laws, initiate legislative proposals, and exert powers in emergency conditions. None of these powers is stereotypical of presidentialism—indeed, some of them are thought to be elective attributes of parliamentarism. Yet they are undeniably important powers with potentially significant consequences for political stability and the quality of democracy. Indeed, it may well be that the dimension of *executive lawmaking authority* is found to be as important as the executive-selection features that distinguish presidential and parliamentary constitutions.

I. The Shadow of the U.S. Constitution

We begin with a historical elaboration of the influence of the U.S. Constitution on Latin American constitutionalism as a way of orienting the discussion. The influence of the U.S. Constitution in Latin America was undoubtedly significant in the early nineteenth century. Among others,

Venezuela's constitution of 1811, Mexico's of 1824, Argentina's of 1826, and Ecuador's of 1830 drew significantly on the American model.[16] Even when not adopted, American institutions were part of the mix of models considered. Argentina's constitution of 1853 was particularly close to the U.S. model, so much so that Argentinian judges routinely drew on U.S. constitutional jurisprudence in interpreting their own constitution for more than a century.[17] Indeed, there was so much borrowing that the great liberator Simón Bolívar was "moved to condemn the 'craze for imitation.'"[18]

To be sure, the U.S. model was only one of several on offer. Latin American elites were fully acquainted with enlightenment thought and drew on eclectic sources, including French and British thought and, notably, the 1812 Constitution of Cádiz, the embodiment of Spanish liberalism.[19] Nevertheless, several features of the U.S. model were particularly attractive. Federalism was the leading example, as it helped accommodate traditions of regional and municipal autonomy within the Spanish empire and served as an attractive model for rural elites fearful of domination by urban centers.[20] Venezuela's 1811 document drew directly and self-consciously on the United States' federal model.[21] Federalist thought was even influential in countries where it was not sustained, such as Chile.[22] As various independent states sought to combine into larger entities, federalism was a natural model. The Central American Federation, which encompassed much of that region from 1823 to 1840, was explicitly federal and drawn from the U.S. model.[23] Gran Colombia, which encompassed the territory of today's Colombia, Venezuela, Panama, and Ecuador from 1819 to 1831, was also a federal republic.[24] Today, Argentina, Brazil, Mexico, and Venezuela remain federal states.[25]

Judicial review was also an American export. Many constitutions in the region adopted explicit provisions empowering the courts to exercise the power of judicial review, a power only implicit in the United States Constitution.[26] To be sure, there were limitations on its exercise. In the widely borrowed Mexican institution of *amparo*, courts could not strike a statute even if they found it unconstitutional; they could only correct its application in particular cases.[27] It is not surprising that, until the emergence of democracy in the late twentieth century, Latin American courts were hardly vigorous in using their powers of review;[28] but the similarity in constitutional form nevertheless set the region apart from other parts of the world.

Other institutions were adopted but then discarded. The right to bear arms existed in many early Latin American constitutions, but by the turn of the twentieth century it had almost been eliminated.[29] The electoral college was influential in early constitutions and survived perhaps longer than it should have, remaining in place in Argentina until 1995.[30] These modifications over time may have reflected a process of updating or modernization, as nations experimented with institutions and found that some worked while others did not.[31]

One of the major borrowings was, of course, the presidency. After a nonnegligible period of experimentation, Latin American countries stabilized under presidential constitutions in the nineteenth century.[32] The choice of a presidential form of government may perhaps be accounted for simply by the fact that it was a model that was available. At independence, Latin American countries were struggling with the same fundamental problem with which leaders of the newly independent United States struggled after 1776: how to constitute executive authority in a context where the monarch was no longer the ruler. Parliamentary government had not yet been codified as such and was in the process of emerging out of recently constitutionalized European monarchies.[33] Parliamentary constitutions in Europe emerged after a gradual

period of negotiation between the monarch and the nobles, in which the parliament ultimately displaced the monarchy as the center of effective governance.[34] In Latin America, by contrast, initial governments, whether revolutionary or not, emerged from a system of monarchy in which a single individual sat at the center of the political system.[35] Even Simón Bolívar, who cloaked his critique of federalism in a general reaction to borrowing from North America, was an admirer of the presidency as a model of a nonhereditary yet strong executive.[36] Thus, the drafters of presidential constitutions in nineteenth-century Latin America did not choose between the presidential and parliamentary models available today, but between a monarchy (headed by a hereditary leader) and a republic (headed by leaders with no claim to heredity).[37]

At that time, the United States represented the most successful republic and one that had emerged under similar circumstances.[38] France, after all, had not yet been able to settle upon a stable and coherent model of republican government.[39] Adoption of a presidential formula was perhaps a foregone conclusion.

At the same time, the *initial* choice of presidentialism does not necessarily explain the endurance of that model. After all, many other institutions were discarded over time through processes of amendment and constitutional replacement. There are reasons, however, to suppose that basic constitutional frameworks—such as the one embodied in the procedures for the selection of the executive—are subject to strong inertial factors. These broad institutions structure the expectations of the actors operating under them and, in order for them to be changed, actors must be willing to leap into the unknown. At the same time, constitutions serve as focal points and are rarely written on a blank slate; previous documents often serve as a template, even if changes are made to address issues identified as leading to crisis in prior systems of government. Thus, in spite of frequent

constitutional replacements in Latin America[40] that in theory would have provided many opportunities to reconsider presidentialism, and in spite of the existence of explicit and vigorous attempts to reform it,[41] the presidential form of government has survived and shows no signs that it will be abandoned any time soon.[42]

This does not mean, however, that when adopted by Latin American countries, presidentialism was taken as a package deal. If it is true that Latin American countries borrowed the presidential solution from the United States, it is not correct to assume that they also borrowed the set of ancillary institutions that structure the powers of the president and the specific ways in which the president is to interact with the legislature. Even if some such ancillary institutions were borrowed, they too might evolve over time to create new variants of presidentialism that bear little resemblance to the U.S. model. Finally, it could be the case that presidential systems are sufficiently internally diverse such that the overall category is hiding important variation. These are empirical questions that have not, to our knowledge, been systematically examined before. It is our purpose in this Article to do just that in the context of Latin America. We approach the issue of government type by examining several internal features that are seen to be essential components of presidential systems. It is to this issue that we now turn.

II. The U.S. Constitution as the Archetype of Presidentialism

As we stipulated above, scholars who focus on the study of political systems see presidential and parliamentary types as representing systems of institutions. As put by Moe and Caldwell, "Presidential and parliamentary systems come with their own baggage. They are package deals."[43] The precise list of attributes that is supposed to be associated with each system is subject to some variation. Some of these attributes may be accidental, while others may follow from the logic of presidential governance. Tsebelis, for example, asserts that "[i]n parliamentary systems the executive (government) controls the agenda, and the legislature (parliament) accepts or rejects proposals, while in presidential systems the legislature makes the proposals

42. We note, of course, that some prominent and recent episodes of constitutional design took up the issue of presidentialism versus parliamentarism, including Argentina in 1993 and Brazil in 1988. For a discussion of frequent replacement of constitutions by these two countries and others, see ELKINS ET AL., *supra* note 25, at 26.

and the executive (president) signs or vetoes them."[44] Others emphasize the following as key attributes of political systems: decree power,[45] emergency rule,[46] veto power,[47] legislative initiative,[48] cabinet formation,[49] and the power to dissolve the assembly.[50] This last feature is so closely linked with parliamentarism that some even include it as a defining attribute.[51]

The United States Constitution represents the archetypical presidential system in the sense that it is the model that represents, often implicitly, discussions of separation-of-powers systems. What defines the U.S. Constitution as presidential is that the executive is popularly elected and does not need the confidence of the legislature in order to remain in office.[52] Other features of the U.S. presidential system may or may not be unique and include the following: First, the U.S. President is unable to dissolve the assembly.[53] Second, the President lacks explicit lawmaking powers and has

Although the power to dissolve the assembly is often considered to be an essential, even defining, feature of the separation of powers system, we do not take this position. Dissolution powers originated in monarchies and are compatible today with all forms of democratic constitutions. Just as there are presidential constitutions that allow dissolution under certain circumstances, there are parliamentary ones that do not. *Compare* CONSTITUCIÓN DE LA REPÚBLICA DEL ECUADOR [ECUADOR CONST.] 2008, art. 148 (listing certain circumstances under which the president can dissolve the national assembly), *with* Przeworski et al., *supra* note 33, at 158 (noting Norway as an exception to the general rule that, in countries operating under a constitutional monarchy, kings can dissolve parliaments).

no constitutional power of executive decree.[54] Third, the President has formal, albeit modest, emergency powers.[55] Fourth, the President lacks the formal ability to initiate legislation but has the power to veto legislation, even if the veto can be overridden.[56] Fifth, the President has the ability to dismiss the cabinet without direct legislative involvement.[57] Sixth, the President has the power of pardon.[58] Seventh, the President is subject to explicit term limitations, although those limits were not formalized until 1951.[59] Eighth, the legislature has explicit powers of oversight over the President.[60] These presumably elective features of presidentialism are the focus of our inquiry.

We are aware that some of these features are not necessarily descriptive of how the U.S. presidential system works de facto. Some of the constraints presidents face might result from informal rather than formal limitations. For example, the two-term limit for presidents had long been observed before it was formalized by the Twenty-Second Amendment.[61] If presidents are formally prevented from setting the legislative agenda, it is not hard for them to find willing legislators to sponsor their bills. On the other hand, if the formal constitution provides for a president devoid of strong constitutional powers, in practice the U.S. President hardly seems weak (or, at least, seems to have gained strength over the years). The expansion in the scope and frequency of executive orders[62] and the ongoing debate about executive powers in times of war attest to this perception.[63] Our goal, however, is to investigate whether the constitutional documents crafted in Latin America correspond to the

archetypical U.S. model of a constitutionally weak president. It may be that Latin American presidents look, on paper, very much like their North American counterparts, in which case we would be tempted to think of presidentialism in a somewhat more systemic light. On the other hand, it is very possible that drafters of Latin American constitutions have sculpted a kind of presidentialism that bears a strong regional cast, which deserves more systematic description. How presidents stray from their constitutional prerogatives is, again, a matter that is left open.[64]

III. Latin American Presidentialism

To what degree can we speak of a Latin American style of presidentialism? Can we identify features of executive–legislative relations that are distinctly Latin American or distinctly *non*-Latin American? How closely do Latin American constitutions follow the United States archetype, or for that matter, other relevant models such as the Spanish 1812 (Cádiz) constitution? Is there, as Loveman claims, a set of provisions unique to the Latin American constitutions that enables the tyranny that has so frequently surfaced in these countries?[65]

Our basic sources are the constitutional documents themselves. We use the data assembled by the Comparative Constitutions Project (CCP), a comprehensive inventory of the provisions of written constitutions for all independent states between 1789 and 2006.[66] Collection of the data is ongoing, and for purposes of this Article, the dataset includes 647 of the 835 constitutional systems identified by Elkins, Ginsburg, and Melton.[67] Elkins, Ginsburg, and Melton include a large number of questions in their survey instrument, many of which have to do with the powers of the executive and the legislature.[68] It is this set of questions that constitutes the basic information we use here.

The period from independence through the end of the 1870s was one of intense constitutional experimentation in Latin America. From 1810 through 2007, the nineteen Latin American countries that exist today designed a total of 231 constitutional systems, 111 of which were written before 1880.

67. A constitutional system consists of a constitution and all its amendments before the constitution is formally suspended or replaced. We use only one event per system in this analysis—typically a new constitution in the first year of its adoption.

68. *See* Zachary Elkins, Tom Ginsburg & James Melton, *The Comparative Constitutions Project: A Cross-National Historical Dataset of Written Constitutions (Survey Instrument)*, COMPARATIVE CONSTITUTIONS PROJECT, 18–81 (May 11, 2010), http://www.comparativeconstitutionsproject.org/files/surveyinstrument.pdf (devoting sixty-four pages to questions about the powers of the executive and the legislature).

Appendix A provides some sense of the population and our sample. Our sample includes 193 of the 231 systems, or 81%. The thirty-eight constitutions missing from our sample tend to be concentrated in the early years after independence.[69] Of the 111 systems adopted (and discarded) before 1880, our sample includes seventy-nine systems—roughly four-fifths of that population. These early years are precisely the years of institutional vacuum that followed independence, when there was the highest degree of constitutional experimentation. That this population of systems is underrepresented in our sample implies that our estimate of intraregional diversity may be biased towards increased homogeneity in the first decades of the nineteenth century.

We start by considering a set of thirteen attributes, ten pertaining to powers allocated to the executive and three to powers allocated to the legislature. Regarding the executive, we consider the following powers: to issue executive decrees, to assume emergency powers, to propose constitutional amendments, to propose the budget law, to initiate regular legislation, to veto legislation, to issue pardons, to appoint and dismiss the cabinet, and to dissolve the legislature. Regarding the legislature, we consider the legislature's power to remove individual ministers, to exercise oversight over the executive, and to override the executive veto (assuming the constitution provides for such veto).

Appendix B presents the proportion of Latin American constitutions with selected executive–legislative provisions over time. For the temporal dimension, we divide the region's history into five eras: (1) a period of economic and political disorganization (independence through 1870); (2) the period of agro-export development, during which most countries in the region were integrated into the international economy as exporters of raw material and importers of industrialized goods (1870–1918); (3) the period of crisis of the export model and emergence of import-substitution industrialization (1919–1945); (4) the period of dominance and then decline of import-substitution industrialization (1946–1979); and (5) the period of democratization and economic reforms (1979–2007).

This table displays a remarkable evolution in executive powers across Latin American constitutions. Let us start, however, with the less remarkable features of the table. Given that most Latin American constitutions have been presidential, it is not surprising that the number of constitutions that allow presidents to dissolve the legislature is relatively small. This number, however, is not trivial: overall, there have been seventeen Latin American constitutions that allowed the executive to dissolve the legislature; of these, eleven are classified as presidential. Equally unsurprising is the fact that close to 90% of the constitutions written since independence have granted the

69. Of the thirty-eight cases not sampled, thirty-two are constitutions that were written before 1860.

executive the power to freely appoint and dismiss the cabinet. And virtually every Latin American constitution grants the executive emergency power (although there is considerable variation regarding the specifics of this power, as we will see below). Finally, many constitutions have established relatively strong legislatures, at least when it comes to oversight of the executive (a feature that has been almost universal since 1870), removal of individual ministers (about one-half of all Latin American constitutions so allow), and override of an executive veto (almost all of the post-World War II constitutions provide for it).

The remarkable development, in our view, is the increase in provisions that grant the executive some lawmaking powers. A high proportion of executives have always been given decree powers in Latin American constitutions, but twentieth-century constitutions rendered this provision almost universal (although, again, there is considerable variation in the specifics of this power, as we will see below). Equally prevalent has been the executive's veto power: close to 90% for the whole period and universal for the post-1979 period. But, whereas less than 10% of the constitutions written in the nineteenth century allowed the executive to propose constitutional amendments, the proportion in the post-1979 period has soared to 90%. Although less dramatic, a similar pattern is evident with respect to the executive's capacity to initiate ordinary legislation and to propose budget legislation.

Thus, we see some convergence in Latin American constitutions in the sense of an expansion of the powers of the executive, particularly executive lawmaking powers. At the same time, powers that were relatively common in earlier constitutions either did not change much or have expanded in more recent times. This pattern can be observed in Appendix C, which plots the proportion of constitutions in force that provide for a given power. This convergence includes the features normally associated with presidential constitutions—the executive's power to appoint and dismiss the cabinet, and the inability to dissolve the legislature. One preliminary observation may be that the data suggest a contemporary pattern of Latin American constitutionalism that combines a strong legislature with a president possessing strong lawmaking powers. This contrasts with the earlier pattern of strong legislatures with presidents possessing few or no lawmaking powers.[70]

How unique is this pattern with respect to other presidential constitutions? Is the evolution of Latin American constitutions toward broader legislative power for the executive a region-specific development, or

70. Interestingly, the earlier pattern has been identified by Shugart and Carey as a configuration *conducive* to regime survival, while the current configuration is viewed by them as detrimental to successful governments. MATTHEW SOBERG SHUGART & JOHN M. CAREY, PRESIDENTS AND ASSEMBLIES 277 (1992). A test of this proposition is beyond the scope of this Article, but we note that the earlier period was associated with instability in constitutional form. *See supra* text accompanying note 69.

is it part of an overall trend, if not in all constitutions, at least in presidential constitutions outside Latin America? Appendix C, which also plots the Latin American trend against the trend in non-Latin American presidential systems, provides some answers to this question. Note that we plot the non-Latin American systems starting in 1940; before that time, there are not enough cases in that subgroup to justify any sort of generalization.[71] In eleven of the thirteen provisions plotted in Appendix C, we observe significant separation between the Latin American and non-Latin American presidential systems (panels 1, 2, 3, 4, 5, 6, 8, 10, 11, 12, and 13). Six of these eleven differences are in the direction of more executive power for Latin American presidents compared with non-Latin American ones (panels 2, 5, 10, 11, 12, and 13); two additional differences are in the direction of more power to the Latin American legislatures over the executive compared with non-Latin American ones (panels 6 and 8). Only in provisions to dissolve the legislature do non-Latin American presidents appear to have an edge in power (panel 1), although this edge is seemingly disappearing. Furthermore, four of the five items in which Latin American presidents exhibit comparatively high power are provisions that can be broadly characterized as lawmaking powers—powers that are, in a sense, shared with the legislatures (panels 10, 11, 12, and 13).

We can explore these comparisons in more aggregate fashion by assessing the similarity between any two constitutions across dimensions of executive–legislative relations. We calculate this quantity simply by computing the proportion of the thirteen features that we considered in Appendix B for which any two constitutions agree (in that they both either include or exclude the provision in their constitutions). Appendix D describes the mean of these measures across various subgroups (all presidential constitutions, Latin American presidential constitutions, non-Latin American presidential constitutions, and non-Latin American, non-presidential constitutions). On average, any two constitutions in the data share nine of thirteen provisions for a score of 0.68. The first thing to note is that presidential systems in general are a more coherent category than either parliamentary or semi-presidential systems. Latin America accounts for the vast majority of presidential systems before 1945; indeed, it is possible that the overall coherence of the presidential category is driven by the similarity of constitutions within the region. After 1945, there is increasing divergence between Latin American and other presidential systems. Non-Latin American presidential

71. Before 1940, there were nine presidential constitutions outside of Latin America: the United States (1789), Haiti (1843 and 1935), France (1848), Germany (1919), Lithuania (1938), Liberia (1847), and the Philippines (1899 and 1935). Since 1940, there have been eighty presidential constitutions written in countries outside of Latin America. Note that the 1919 German constitution did not explicitly provide for a directly elected president, and for this reason it is not classified as a semi-presidential constitution. For the classification of constitutions as presidential, parliamentary, and semi-presidential, see generally Cheibub, Elkins & Ginsburg, *supra* note 9.

systems exhibit the same level of coherence as non-presidential systems after 1945, while presidential systems within the region seem to be becoming more similar.

The similarity between Latin American constitutions and the United States Constitution is not particularly high, relative to other models. The two other models that influenced Latin American constitution makers after independence were France's constitution of 1791 and Spain's 1812 (Cádiz) constitution.[72] Both of these constitutions (as well as their close cousins, the Portuguese constitution of 1822 and the Norwegian constitution of 1814) carved out a subordinated position for the monarch in an otherwise-republican document and represented the leading alternative model.[73] Latin American constitutions are not especially similar to any one of these documents. The mean similarity between Latin American constitutions across the sample and each of these documents is not significantly different from the mean similarity of any two constitutions. Thus, even though Latin Americans ultimately settled on the form of government conceived by their North American brethren—a president popularly elected for a fixed term in office—they did not necessarily adopt the same ancillary provisions regarding the specific allocation of powers between the executive and the legislature. This suggests that the adoption of presidentialism in Latin America was less the product of automatic or mechanistic borrowing from the U.S. Constitution and more the adoption of a particular institutional solution discovered by the North Americans to the problem that Latin Americans were facing: how to establish a national executive once the monarch had been removed. Nevertheless, the executive that they designed had as much in common with the Spanish Prime Minister as it did with the U.S. President.

IV. Executive Lawmaking Power as a Signature Feature of Latin American Presidentialism

To the extent that Latin American constitutions represent a distinct breed of presidentialism, the distinction is manifested in the strong lawmaking power that they vest in the president. By lawmaking power, we mean here the powers of emergency, decree, and the initiation of constitutional amendment and legislation. We examine these provisions in some detail below.

A. *Emergency Powers*

A word is in order as to why we consider emergency powers to be legislative in nature. First, periods of emergency rule generally allow for the temporary delegation of considerable powers—including those normally vested in the legislature—to the executive.[74] The easier it is to declare a state of emergency, the more likely it will be that the executive will predominate and in some cases even usurp legislative authority strategically. Second, the executive may be able to act without legislative authorization, as Ferejohn and Pasquino recognized in their study distinguishing between constitutional and legislative models of emergency powers.[75] In their legislative model, ordinary legislation facilitates emergency power, and so there is not a true "regime of exception"[76] outside constitutional constraints.[77] But much depends on the specific assignment of powers to declare an emergency and then to legislate during one.

The U.S. Constitution provides for relatively narrow emergency powers. The relevant clause provides that "[t]he Privilege of the Writ of Habeas Corpus shall not be suspended, unless when in Cases of Rebellion or Invasion the public Safety may require it."[78] By contrast, Bolivia's 1851 emergency provision imagines broader powers for the president ("to assume extraordinary faculties") but also requires the consent through countersignature of all ministers of state in order to establish emergency conditions.[79] This is a model with a legal constraint, but it does not fit the legislative model fully because the legislature has no involvement. According to Loveman, it is precisely these sorts of expansive emergency provisions that

have threatened the political stability in the region almost from the beginning.[80]

Nevertheless, emergency provisions vary in important ways across Latin American constitutions. Appendix E, which reports the proportion of constitutions that contain various emergency provisions, demonstrates some of this variation. The variation spans at least three dimensions: (1) the identity of the actors (in addition to the executive) involved in the process of declaring the existence of an emergency situation; (2) the conditions under which emergency can be declared; and (3) limitations on the actions taken under emergency conditions. The last two rows of Appendix E present, respectively, the proportion of constitutions that require the legislature to play *some* role in the process of declaring an emergency (i.e., it must approve, or at least be consulted before, the declaration of an emergency), and the proportion of constitutions that explicitly specify the conditions under which an emergency may be declared. Across these dimensions, we focus on four specific aspects of emergency provisions: (1) the participation of the legislature in the emergency process; (2) the reference to internal security reasons as a justification for emergency powers; (3) the explicit provision for the suspension or restriction of rights during emergency; and (4) the prohibition of constitutional amendments during emergency rule.

Several patterns are worth noting. The first is that almost all presidential constitutions contain emergency provisions, whereas 73.6% of parliamentary and 81.0% of semi-presidential constitutions do. Indeed, every Latin American presidential constitution written since independence contains a provision for the executive to declare an emergency, compared with 94.4% of non-Latin American presidential constitutions.

The role of the legislature in the process of emergency declaration is smaller in presidential constitutions than it is in either parliamentary or semi-presidential ones. Only 19.0% of Latin American presidential constitutions require that the legislature approve the state of emergency, and an additional 1.9% require that the legislature at least be consulted, whereas 43.5% of non-Latin American presidential constitutions require some form of legislative participation (approval or consultation). There is a trend toward increasing the participation of legislatures in declaring emergencies, but this trend is weaker in presidential constitutions in Latin America than elsewhere: of the more recent (post-1979) constitutions, 36.8% of Latin American presidential constitutions require legislative participation, while 55.9% of non-Latin American, non-presidential constitutions do.

It is likely that the criteria stipulated in a constitution for identifying an emergency tell us something about the flexibility of the executive's power under these conditions. We can speculate that constitutions that limit

---

80. *See* LOVEMAN, *supra* note 46, at 6–9 (stating that while the clauses granting emergency powers "did not cause violence and dictatorship," they "are the constitutional foundation for tyranny almost everywhere in Latin America today").

emergencies to natural disasters are less flexible than ones that allow for emergencies for public security reasons. Further, we can speculate that constitutions that allow for emergencies in response to *internal* security issues are particularly broad, since they do not require an external trigger such as an invasion. We find that reference to internal security reasons as a justification for the state of emergency is more common in presidential than it is in parliamentary or semi-presidential constitutions; it is more common in Latin American than in non-Latin American presidential constitutions; and although it has become more common in all constitutions over the years, it is considerably more common in Latin American presidential than in non-Latin American, non-presidential constitutions. Emergency rule seems easier to invoke in Latin America than it does elsewhere.

Presidential and parliamentary constitutions are equally likely to contain an explicit provision allowing for the suspension or restriction of rights during emergency rule. Among presidential constitutions, however, those in Latin America are considerably more likely to allow for the suspension of rights than those outside of Latin America. The proportion of Latin American presidential constitutions with such a provision has hovered around 90% in the post-World War II period.

Finally, only a small proportion of all constitutions explicitly forbid legislative dissolution or constitutional amendments during emergency rule. It is not surprising that this proportion is much smaller in presidential than in parliamentary and semi-presidential constitutions, since assembly dissolution by the executive is not a common item on the ordinary menu of presidential powers outside assembly-confidence systems.[81] Latin American presidential constitutions, however, are about one-fifth as likely as non-Latin American presidential constitutions to contain a provision prohibiting legislative dissolution under emergency rule. We do not know if this distinction reflects the fact that a Latin American presidency is particularly empowered vis-à-vis the legislature (because it is free to dissolve the assembly) or disempowered (because it is never allowed to dissolve the assembly and so the constitution is silent about the rule during emergencies), but it is at least possible that the former is the case. To summarize, Latin American presidential constitutions are relatively less likely to require some form of legislative participation for the activation of emergency powers; more likely to permit internal security concerns as justifying the state of emergency; and more likely to explicitly allow for the suspension or restriction of rights. This is largely consistent with Loveman's claims.[82] It seems unlikely, however, that the presence of these provisions exhibits any causal relationship with the instability that has

81. *See* CHEIBUB, *supra* note 13, at 10 (remarking that the threat of dissolution is "absent, by design," from presidential constitutions); *cf.* Ginsburg, Melton & Elkins, *supra* note 59, at 1816 (noting that in popular-election systems, the legislature and executive are constituted independently, while in assembly-confidence systems, either branch can dissolve the other).

characterized Latin American republics since independence, as Loveman suggests. Some of the features that might have been conducive to providing incentives for executive unilateral action—such as the lack of legislative involvement, the suspension of rights, and the reference to internal security—are relatively new developments; the early constitutions, which according to Loveman provided the foundations of tyranny in the region, did not possess all of these provisions.

B. Decree Powers

Executive decree powers give the executive the ability to issue binding rules with the force of law and are an important feature of modern governments,[83] being found in about two-thirds of all constitutions. The design of decree powers varies widely across cases, as illustrated in Appendix F, and their rationale and distribution depends on the broader political system: about 70% of both semi-presidential and presidential constitutions provide such power for the executive, while only half of parliamentary systems do so. In systems with fused governmental powers (parliamentary and some semi-presidential constitutions), the decree power for the executive is usually conceived as the exercise of delegated power from the legislature. The legislature, therefore, is frequently designated as the body that must approve an executive decree in those systems. In contrast, only 27.0% of presidential constitutions designate the legislature as the approving body of executive decree powers. Instead, such systems often require that the executive approve the decree, meaning in practical terms the cabinet in most cases. This is consistent with a conception of separation of powers and the notion of a discrete realm of executive lawmaking.

In neither system is it the case that executives are unconstrained in their ability to issue decrees. In fact, the difference between the three systems almost disappears when we consider whether the constitution specifies that some governmental body—be it the legislature or the cabinet—must approve executive decrees. The numbers (not shown in the Appendix) are 68.3% for presidential constitutions and 73.2% for both parliamentary and semi-presidential constitutions.

In keeping with the logic of fused powers and delegated authority, parliamentary and semi-presidential constitutions are twice as likely as presidential constitutions to stipulate that, once issued, executive decrees are immediately effective. Presidential constitutions are significantly more likely than parliamentary and semi-presidential constitutions to require that the approving body (the legislature or the cabinet or both) approve the decree before it becomes effective. Thus, at least in this respect, the executive is

---

83. *See* John M. Carey & Matthew Soberg Shugart, *Calling Out the Tanks or Filling Out the Forms?*, *in* EXECUTIVE DECREE AUTHORITY 1, 9, 15–19 (John M. Carey & Matthew Soberg Shugart eds., 1998) (defining *decree* as "the authority of the executive to establish law in lieu of action by the assembly," and discussing its appeal as a component of democratic government).

more constrained in presidential than in parliamentary and semi-presidential constitutions.

When it comes to the validity of the decree, there are two basic situations. In the first, the decree, once issued, is permanent unless it is explicitly rejected by the legislature; in the second, the decree expires after its pre-specified duration period unless it is explicitly extended by the legislature. The first situation favors the executive: the decree becomes the status quo and the legislature must act in order to change it. The second situation favors the legislature: the status quo ante is restored unless the legislature prefers the situation generated by the decree. The biggest difference we observe across systems is that presidential constitutions are less likely to specify who must act, and in what way, once the executive decree is issued: only 18.4% of presidential constitutions (as compared with 36.5% of parliamentary and 28.3% of semi-presidential) clearly state what must ensue after the decree is issued.[84] This, of course, allows for a degree of ambiguity, the result of which cannot be specified in the abstract. Our guess is that the lack of specification is a problem for the working of these constitutions.

As with emergency powers, some features of executive decree regulation seem to characterize a particularly Latin American model of presidentialism. First, constitutions with executive decree power are more frequent in Latin American presidential constitutions than in non-Latin American presidential constitutions. While almost half of non-Latin American presidential constitutions render the executive decree immediately valid upon issuance, only a small fraction (5.7%) of Latin American presidential constitutions do the same. However, when not left unspecified (as 42.7% of Latin American constitutions do), 46.8% of Latin American presidential constitutions require the action of the approving body before the decree becomes effective. This implies a routinization of presidential decree making, though we do not know the extent to which these formal constraints actually serve to prevent presidents from pursuing their preferred policies. Finally, Latin American presidential constitutions are far more likely (87.9%, as compared to 44.0% for non-Latin American presidential constitutions) to leave the issue of decree validity unspecified, remaining silent about what happens once the decree is issued. To the extent that the decree changes the status quo and the constitution is silent as to whether the status quo ante can be restored, we believe that this lack of regulation tends to favor the executive—though it is hard to be sure in the absence of more detailed information on de facto practices.

84. These numbers refer to the sum of the rows labeled "Permanent, unless repealed" and "Naturally expires, unless extended" in Appendix F.

C. Constitutional Amendment and Initiation of Legislation

It is not surprising that most constitutions provide some mechanism for their amendment.[85] But not all of them allow the executive to propose such amendments. As we can see in Appendix G, only 43.2% of the world's constitutions that specify amendment procedures allow the executive to propose constitutional amendments. This proportion is considerably higher in semi-presidential than in parliamentary and presidential constitutions; among presidential constitutions it is higher in non-Latin American constitutions, although almost 90% of the more recent post-1979 Latin American presidential constitutions allow the president to propose constitutional amendments.

In addition to constitutional amendments, a large proportion of constitutions provide for a legislative process involving budget bills. Again, this is not surprising since the budget is probably the most important piece of legislation that comes regularly before a legislative body. It is interesting to observe, however, that even though a large proportion of presidential, parliamentary, and semi-presidential constitutions provide for an explicit legislative process around the budget bill, almost half of presidential constitutions allow the executive to initiate the budget bill, compared to less than one-fifth of parliamentary and semi-presidential constitutions. Moreover, Latin American presidential constitutions are almost twice as likely as non-Latin American presidential constitutions to allow the executive to initiate budget bills. This is true for all historical periods and has increased in the more recent periods.

It is commonly argued that presidential constitutions do not provide a constitutional mechanism to break deadlocks or impasses between the legislature and the executive when they emerge.[86] The fixed nature of the legislative and executive terms, it is argued, deprives political actors of the opportunity to remove the government constitutionally when a crisis emerges.[87] Yet, as Appendix G indicates, at least when it comes to the budget, a large proportion of constitutions stipulate what should happen in case a budget is not approved. Whereas it is true that presidential constitutions—as compared to parliamentary and semi-presidential—are least likely to specify the default situation in case the budget bill fails, over half of these constitutions still do so. In presidential constitutions, the practice is to either adopt the previous year's budget or to adopt the budget that

85. In our sample, there are nine out of 444 (representing 1.99%) constitutions that do not explicitly provide for a revision mechanism; two are presidential, six are parliamentary, and one is semi-presidential. None of these is in Latin America.

86. *See, e.g.*, Shugart & Mainwaring, *Rethinking the Terms of the Debate*, *supra* note 12, at 32 (observing that constitutional mechanisms for resolving these kinds of conflicts are of "doubtful democratic legitimacy").

87. *See, e.g.*, *id.* at 30 (explaining that while most presidential systems with fixed executive terms have provisions for impeachment, "they offer less flexibility in crisis situations because attempts to depose the president can easily endanger the regime itself").

was proposed by the executive. Other solutions, including adopting the budget proposed by the legislature, are less commonly adopted.

As to the other types of laws—organic laws, finance, tax, and spending bills—a considerably smaller proportion of constitutions specify a legislative process to approve them, and among those that do so, the proportion that allows for the executive to initiate them is also relatively small, with the exception of spending bills. There is no discernible pattern across regime type and region when these processes are considered together. The only noticeable thing is that post-World War II constitutions are more likely to specify legislative processes around these various bills, and when they do so, they are more likely to allow the executive to initiate them.

Thus, the trend we identified earlier regarding increasing powers of legislative initiative granted to presidents in Latin America is primarily due to the fact that, in this region, presidents are allowed to set the agenda when it comes to constitutional amendments and budget laws. These are probably the two most important regular legislative activities in any political system, and granting the executive such powers is of great significance in terms of overall political impact. In short, the executive is a legislative leader in Latin America.

V. Is Presidential Lawmaking Desirable?

Our analysis has emphasized the concentration of lawmaking authority in the executive, a trend that has occurred over time in many political systems, but one that we have argued has been especially pronounced in Latin America. This is of course a major departure from the Montesquieuan conception of separated powers, in which lawmaking is done by the legislature and the only role of the executive is to *execute* the laws.[88] Such a conception was highly influential for the American founders, whose design of a constitutional scheme shaped the approach of subsequent constitution makers.[89] In the eighteenth century, the separation of powers scheme was

seen as normatively attractive to prevent tyranny.[90] We thus must ask whether the erosion of this separation, particularly through the agglomeration of lawmaking power in the executive, enables tyranny. We also should try to understand why the agglomeration has occurred, so as to consider whether there are offsetting normative advantages.

In understanding the positive question of why the concentration of power has occurred, one can distinguish two broad positions that are not completely incompatible. One argument is that the concentration of lawmaking authority in the executive is a response to the exigencies of modern government. The other is that the concentration reflects a self-conscious power grab by the executive. These positions have very different normative implications: if we think concentration of lawmaking authority is functional in some sense, then it is obviously more attractive than if it merely reflects the self-aggrandizement of one branch.

Consider first the functional argument. With the rise of the administrative state, the scope of government activity has dramatically increased, with a need for regulation that can respond to changing conditions in technically complex areas. The executive is the head of the administration, which is staffed with bureaucrats who have the relevant policy expertise to make such decisions. Thus, the apparent concentration of lawmaking authority in the executive hides a dispersion of power within the larger administrative state. But the fact of administrative lawmaking is a necessary response to complexity.

This argument helps one to understand why we would observe the expansion of legislative initiative within the executive branch. Experts who are charged with solving problems and adjusting regulations to changing circumstances may want to be proactive in lawmaking and not simply wait for the generalist legislature to take the lead. A presidential initiative is an acknowledgement of the fact that it is the executive that will make the relevant decisions about the content of regulation.

Similarly, the expansion of executive decree power may in part reflect the need for technical regulation that every political system faces. Whether under delegated authority from the legislature or under powers assigned directly to the executive, the modern administrative state requires that the technical details of complex regulatory schemes be made by experts. Decree authority is one mode of such lawmaking.

The concentration of lawmaking in the presidency in particular provides for another functional advantage: accountability. In the United States, it has

POL., 391, 393 (1991) (book review) (describing how the delegates of the Constitutional Convention of 1787 relied on Montesquieu's notion of separation of powers to "devise a check upon legislative dominance that would not itself devolve into tyranny").

been argued that the rise of the so-called "plebiscitary presidency" has changed the structure of the office.[91] Presidents are typically the only figures elected by a national constituency and hence are more likely to reflect the preferences of the median voter.[92] Congress, in contrast, is seen as responding to a myriad of local interests, and hence it is not expected to produce policies truly in the national interest.[93] Furthermore, policy in Congress is produced through a complex process of committees, vote trading, and negotiation across houses, which makes it difficult to assign responsibility for any particular policy. When a single individual holds responsibility, the public clearly knows whom to blame or credit for policies. Executive lawmaking, in this view, facilitates accountability.

In contrast with these functional accounts, some have asserted that the concentration of authority in the presidency reflects a naked power grab. This is the view associated with Loveman and others who argue for the continuing relevance of the *caudillo* tradition in Latin America.[94] These scholars emphasize the use of the emergency power by Latin American presidents.[95] The emergency power, they show, has long been used to take power from the legislature and leads to periods of executive tyranny.[96] The assignment of decree power to the executive, in this view, also comes at the expense of the legislature, in that the executive can use that power not only with regard to the technical details of delegated lawmaking, but also for setting the broad outlines of policy.[97]

A full evaluation of these competing positions is beyond the scope of this Article, but we lean toward the view that there is something quite functional about the expansion of executive lawmaking authority. There are two reasons for our view. First, we observe the increasing power of single

individuals even in pure parliamentary systems, where scholars have spoken of the presidentialization of the office of prime minister—a phenomenon that has resulted from the structure of political parties and the ubiquity of media coverage of politics.[98] This suggests that there is indeed something to the argument that having a single individual at the center of the political system enhances accountability. Second, the argument about tyranny is largely rooted in historical experience rather than contemporary reality. It assumes that long-run institutional patterns of behavior are enduring. For much of Latin American history, this was an understandable position. But we are now in an era of widespread democratic government in Latin America, with all the countries of the region observing formal norms of democracy. The trend toward democracy has accelerated since the 1980s, which covers part of the period in which we find enhanced powers of executive lawmaking. We do not assert that the two phenomena are causally related, but their contemporaneous occurrence suggests prima facie that democracy is not incompatible with expanded executive lawmaking. One can contrast the presidential systems in Africa, which form the bulk of our comparison group and in which democratic norms are much less frequently observed. As a normative matter, then, we believe the Latin American presidential pattern is one to be celebrated rather than condemned.

VI. Conclusion

We have analyzed the formal features of executive power in Latin America, a region long understood to be one amenable to strong executive rule. We have demonstrated that, although the presidency was inspired by the American model, other models were equally influential in structuring the precise contours of executive and legislative power in the region. We have also seen increasing convergence within the region along important dimensions of executive–legislative relations. We can thus speak of a Latin American model of presidential power that includes a powerful role in legislation as well as extensive emergency rule. This distinguishes the Latin American presidency from those in other regions of the world.

Our analysis has several implications for the study of comparative law and politics. First, it calls attention to geography as an important predictor of constitutional design. Second, our analysis emphasizes change rather than continuity and convergence over time. This approach contrasts with the recent emphasis in comparative law on "legal origins" as determinants of

contemporary outcomes.[99] Finally, while the legal-origins analysts emphasize the importance of French law in Latin America,[100] our account shows that at a constitutional level, the influence of Spain and the United States was also significant in the early years. But while the legal-origins school argues for long-range consequences of initial choices, we observe a gradual process of constitutional updating in which constitutions within the region grow more similar to each other, and a move away from the models from which they were initially drawn.
