Privacy versus Antidiscrimination

Lior Jacob Strahilevitz*

Abstract:

This essay argues that there is often an essential conflict between information privacy protections and antidiscrimination principles. Where information privacy law or practical obscurity deprives an employer of pertinent information about a job applicant, the employer often will rely more heavily on distasteful statistical discrimination strategies. For example, the existing empirical evidence suggests that criminal background checks may benefit African American male job applicants as a whole, by permitting employers to sort among ex-cons and those lacking criminal records. In the absence of accurate criminal history information, employers concerned about keeping ex-offenders out of their workplace appear to hire too few African American males – penalizing African American males without criminal records and hiring ex-cons who are members of groups with low offending rates. The essay therefore argues that in the employment context, the government should use information policy as a supplement to traditional antidiscrimination law. More precisely, the government can publish previously private information about individuals so as to discourage decisionmakers’ reliance on problematic proxies. An important implication of this insight is that there may be strong antidiscrimination rationales for Megan’s Laws, more recent efforts by a handful of jurisdictions to make general criminal history information freely available on the Internet, and government subsidies for programs that make employee’s prior work evaluations easily available to prospective employers. The essay further explains why in those settings where the reintegration of ex-cons into the workplace creates societal benefits, information privacy protections for criminal history status will rarely, if ever, be the most appropriate tool for achieving those benefits. The essay concludes by identifying situations in which publishing previously private information about individuals would be a poor strategy for decreasing the prevalence of discrimination.

* Professor of Law and Walter Mander Teaching Scholar, University of Chicago. The author thanks Ronen Avraham, Howard Beale, Nevin Gewertz, Bernard Harcourt, Uri Itkin, Ronald Lee, Doug Lichtman, Tom Miles, Beth Milnikel, Jide Nzelibe, Adam Samaha, Max Schanzenbach, Paul Schwartz, and David Weisbach for their comments and suggestions, Levi Giovannetti for research assistance, and the Morton C. Seeley Fund and Visa, U.S.A., Inc. for generous research support. The author particularly thanks participants in the University of Chicago Law School’s Surveillance Symposium for their suggestions, as well as workshop participants at Northwestern and the University of Chicago.
Thanks to the adoption of Megan’s Laws in all fifty states and the rise of a large background check industry that caters to employers, landlords, lenders, and other important decisionmakers, information about criminal histories is becoming more accessible than ever before. The same is true of financial information, such as bankruptcy records, credit records, and other evidence of past financial distress. Google and other search engines have made it easier for decisionmakers to locate other information about individuals that may have some bearing on their fitness for a job, an apartment, a loan, or another opportunity. For the most part, information privacy scholars have bemoaned these developments.1 Privacy critics have responded by suggesting that the availability of this information results in more accurate decisions about hiring, and that efforts to use privacy law to block the dissemination of this information will compromise economic efficiency.

This paper seeks to add one important argument to the debate over the proliferation of information about individuals’ involvement in the criminal justice system, financial distress, or other embarrassing activities. It suggests that by increasing the availability of information about individuals, we can reduce decisionmakers’ reliance on information about groups. Put another way, there is often an essential conflict between information privacy protections and antidiscrimination principles, such that reducing privacy protections will reduce the prevalence of distasteful statistical discrimination. The paper draws heavily on a series of recent economic papers finding that in the absence of accurate information about individuals’ criminal histories, employers who are interested in weeding out those with criminal records will rely instead on racial and gender proxies.

In framing this project, it is worth identifying my priors at the outset. I care about information privacy protections. But I care more about antidiscrimination protections. Were it possible to sacrifice information privacy interests to reduce the prevalence of racial discrimination or other forms of unlawful discrimination, that is a tradeoff that I would be willing to make, particularly where the information privacy interests at stake implicate neither intimate association nor political association. Some readers may not share that hierarchy of interests, but my goal in this project is to help advocates of greater information privacy protections recognize all the collateral consequences of those policies.

I. The Tradeoff between Privacy and Antidiscrimination

Newspaper reporters have recently noticed the difficulties that African American professionals in big cities encounter when trying to hire a nanny. Young couples expressed frustration that among nannies, African American clients were widely seen as being too demanding, living in unsafe neighborhoods, or unable to pay as much as white couples.\(^2\) Perhaps most frustrating of all: these stereotypes seemed to be shared by nannies of all races, including African-Americans and Caribbeans.\(^3\) Similar phenomena have been used to explain the difficulties that African American professionals have hailing cabs successfully – African American riders are viewed as less safe passengers and poorer tippers.\(^4\) Waiters similarly perceive African Americans as poor tippers, an expectation that becomes a self-fulfilling prophecy if African Americans receive less attentive service as a result.\(^5\)

Racial animus explains some of this behavior, but in the standard narrative, statistical discrimination is doing most of the work.\(^6\) That is, nannies are looking for good employers and associate race with employer quality. After all, if African American

---

\(^3\) *Id.*

nannies are reluctant to work for African American parents, it is hard to construct a compelling animus-based story about why that would be so. Along the same lines, cab drivers are looking for good tippers and reliable payers, and believe that passenger race predicts these behaviors. Statistical discrimination is based, not on irrational animus, but on the use of heuristics by decisionmakers who believe – correctly or not – that observable hallmarks of membership in a group correlates with some undesirable characteristic. One premise of this paper is that in modern America, statistical discrimination is more prevalent than animus-based racism.\(^7\) It is in many ways a more tempting form of discriminatory behavior, since, unlike animus-based discrimination, it will often be rational.

To illustrate how statistical discrimination plays out in contemporary society, suppose a person charged with hiring a sales clerk wants to avoid employing someone with a criminal background. A majority of employers evidently refuse to hire ex-convicts, and this reluctance stands in sharp contrast to their widespread willingness to hire members of other stigmatized groups, such as welfare recipients, GED holders, and applicants who had been unemployed for a year or longer.\(^8\) We can tell a number of stories about why this particular aversion to hiring ex-offenders is rational.\(^9\) Someone with a criminal conviction in his past could be less trustworthy than someone without such a conviction. Hiring someone with a criminal background could expose an employer to vicarious liability under a variety of theories, and in some job sectors it is unlawful to

Holzer et al., \textit{Will Employers Hire Former Offenders?: Employer Preferences, Background Checks, and Their Determinants,} in \textit{Imprisoning America: The Social Effects of Mass Incarceration} 205, 210-11 (Russell Sage Found. 2004) (“Approximately 92 percent of employers indicated that they would definitely or probably hire former or current welfare recipients, 96 percent indicated that they would probably or definitely hire workers with a GED in lieu of a high school diploma, 59 percent indicated that they would hire workers with a spotty employment history, and 83 percent indicated that they would probably or definitely consider an application from an individual who has been unemployed for a year or more. In contrast, only 38 percent of employers said that they definitely or probably would accept an application from an [sic] former offender.”).

\(^9\) For an illuminating discussion of the legal and moral issues implicated by this sort, and other sorts, of profiling, see \textit{Frederick Schauer, Profiles, Probabilities and Stereotypes} 16-17, 155-223 (Belknap Press 2003).
hire someone with a felony conviction.\textsuperscript{10} In any event, assuming the decisionmaker lacks reliable access to information about applicants’ criminal records, he might choose to hire a Caucasian female over an equally qualified African American male, based on the relatively high percentage of African American males and the relatively low percentage of Caucasian females who are involved in the criminal justice system. This decisionmaking process will impose a distasteful form of collective punishment on African American males who have had no run-ins with the law, penalizing them for crimes that others have committed. Because many decisionmakers may exercise the same decisionmaking criteria, a law-abiding African American male may face repeated rejection and economic marginalization.\textsuperscript{11} For these reasons, antidiscrimination law prohibits the use of these race or gender proxies even where race or gender might correlate with some relevant qualification.\textsuperscript{12}

Policing statistical discrimination has proved difficult: many victims of this sort of discrimination never bring suit, many non-victims do bring suit, and enforcement of the laws by the Justice Department and state attorneys general has been sporadic.\textsuperscript{13} Concerned about an avalanche of claims, a number of appellate courts have imposed substantial burdens on plaintiffs seeking to enforce antidiscrimination laws, often hamstrung by discovery, interpreting statutes of limitations aggressively, or hastening resolution of claims on summary judgment.\textsuperscript{14}

A. Empirical Evidence of Statistical Discrimination

A fascinating recent paper in the *Journal of Law and Economics* by Holzer, Raphael, and Stoll illustrates the prevalence of statistical discrimination and the failure of antidiscrimination laws to curtail it. The paper began by noting that 28 percent of African American males, 16 percent of Hispanic males, and 4 percent of white males would be incarcerated at some point in their lives, and that the median prison sentence was less than 2 years. As a result, Holzer and co-authors observed that a sizable minority of the male labor pool in the United States consists of people with criminal records. The study then surveyed employers about their most recent hire for a position that did not require a college degree. The authors collected demographic information about each firm’s most recent hire and information about the firm’s willingness to hire employees with criminal records generally.

The findings of the study suggested that statistical discrimination against African Americans males is widespread, and that employers were using race as a proxy for involvement in the criminal justice system. Employers who conducted criminal background checks on applicants were more than 50% more likely to hire African Americans than employers who did not (24% versus 14.8%, respectively). Consistent with the statistical discrimination hypothesis, the effect was highly significant for employers who expressed unwillingness to hire ex-offenders (10.7% greater likelihood) and only marginally significant for employers who stated their willingness to hire ex-offenders (4.8% greater likelihood.) The effects for African American males were far greater than the effects for African American females, which is consistent with the statistical discrimination hypothesis and hard to square with a racial animus hypothesis. Further, the study found the same effects even after controlling for differences in the racial composition of the applicant pool. The study also found evidence that surveyed

20 Id. at 465-66, 470-71.
21 Id. at 474.
employers who do not conduct criminal background checks used other proxies for criminal convictions as well, including spotty work history and being unemployed for more than a year, and that those employers who expressed unwillingness to hire ex-offenders were significantly less likely to hire members of these stigmatized groups.\textsuperscript{22}

Surveying their results, the study authors reached the following conclusion about the effects of statistical discrimination on African American job applicants:

\[[T]he\ empirical\ estimates\ indicate\ that\ employers\ who\ perform\ criminal\ background\ checks\ are\ more\ likely\ to\ hire\ black\ applicants\ than\ employers\ that\ do\ not.\ \ldots\ [T]his\ positive\ net\ effect\ indicates\ that\ the\ adverse\ consequences\ of\ employer-initiated\ background\ checks\ on\ the\ likelihood\ of\ hiring\ African\ Americans\ is\ more\ than\ offset\ by\ the\ positive\ effect\ of\ eliminating\ statistical\ discrimination.\ \ldots\]

In addition, we find that the positive effect of criminal background checks on the likelihood that an employer hires a black applicant is larger among firms that are unwilling to hire ex-offenders. This pattern is consistent with the proposition that employers with a particularly strong aversion to ex-offenders may be more likely to overestimate the relationship between criminality and race and hence hire too few African Americans as a result.\textsuperscript{23}

The implications of the study and of similar studies on the employment market by the same authors, are horrifying, but they should not be surprising. Many employers wish to avoid hiring ex-offenders. Employers who expend resources on criminal background checks will be able to sort effectively among those African Americans who have had run-ins with law enforcement and those who have not, but other employers will rely on race as a proxy for criminality, imposing a distasteful sanction on law-abiding African American males. According to the Holzer study, information privacy protections for ex-cons seem likely to harm African American males as a whole, because they thwart employers’ ability to sort between those African American males who have criminal records and those who do not.\textsuperscript{24}

\textsuperscript{22} Id. at 472.
\textsuperscript{23} Id. at 474. One of the authors of this study recently hedged this conclusion somewhat, noting that the desirability of promoting access to criminal records would depend on the amount of time for which a prior conviction would act as a reliable proxy for future conduct, and the degree of nuance in employer reactions to prior convictions. Steven Raphael, \textit{Should Criminal History Records Be Universally Available?}, 5 Criminology & Pub. Pol'y 512, 516-17, 519-20 (2006).
\textsuperscript{24} Holzer et al., \textit{supra} note , at 474.
The Holzer et al. research comprises the most technically impressive papers to tackle this particular issue, but they are not the only scholars to examine these questions. A handful of other papers have examined the effects of increased automation of criminal history records on the aggregate employment of ex-offenders and racial minorities, and they reached divergent conclusions. Keith Finlay, a graduate student in Economics at UC Irvine, concluded in an unpublished paper that the automation of criminal history records and their availability on the Internet in some states was associated with a decrease in the employment of young African American males of slightly more than 2%. These results were statistically significant. By contrast, Shawn Bushway, a Professor of Criminology at SUNY-Albany, used essentially the same data set, and found that African Americans have higher wages in those states that have automated access to criminal history records to the greatest degree, and he attributes this finding to statistical discrimination in those states that have not automated access. Unlike Finlay, Bushway found that access to criminal history records did reduce the differential between whites’ wages and blacks’ wages and the differential between whites and black employment levels, but the results were not statistically significant. There were minor methodological differences between the two papers that probably explain the differing results. More puzzling is a follow-up unpublished paper that Finlay recently posted on the Internet, which finds that wages for ex-offenders are significantly lower in states with more accessible criminal records, that the wages of black male non-offenders are lower in states with more accessible criminal

26 Finlay and Bushway both used employment data from the Current Population Survey, though the years they selected differed, and a ranking of Internet accessibility of criminal history records prepared by the Legal Action Center in 2004. Finlay used the Legal Action Center’s rankings as a starting point, and supplemented them with his own estimates of when the publication of criminal history information began. Although the Legal Action Center’s ratings attempted to report the relative degree of accessibility, Finlay appears to have transformed accessibility into a binary choice. See Finlay, supra note 25, at 30 notes a & b. Bushway, by contrast, did not modify the Legal Action Center’s rankings. See Bushway, supra note 10, at 288.
27 Bushway, supra note 10, at 282 (summarizing the findings of his 1996 dissertation).
28 Id. at 287.
29 In addition to the differences mentioned in note 26, Bushway focused on African American employment generally and Finlay focused on young African American males.
records (but that the same is true for black females),\textsuperscript{31} and that “non-offenders from groups with higher predicted probabilities [of offending] have better employment outcomes in states with more open criminal history records. This is consistent with employer statistical discrimination in the absence of readily available criminal background checks.”\textsuperscript{32} Finlay’s most recent paper forthrightly concludes that it is hard to know what to make of statistical discrimination in employment in light of the inconsistent nature of his findings and incompleteness of the data.\textsuperscript{33}

Reflecting on the Finlay and Bushway research, I suspect that neither author’s work sheds much light on the subject because both authors are using a noisy data set, and one that is difficult to replicate.\textsuperscript{34} Finlay and Bushway both emphasize the differences among jurisdictions in the availability of criminal history information. But because a large number of proprietary firms make national criminal record searches available for a small fee, it is not clear how much of a difference actually exists between the open-records and closed-records states that those scholars identify. Indeed, open records does not mean free access. Washington state, characterized by Finlay as an open-records jurisdiction, does make criminal history records available over the Internet, but at a cost of $10 per search.\textsuperscript{35} It is plausible that most Washington-based employers would prefer to pay a commercial data broker $30 or $40 to search criminal records nationally, as opposed to $10 to search records in one state. If that is the case, then the difference between open-records and closed-records jurisdictions will be too noisy a variable.

To sum up the available data, then, the Holzer et al. research is the best information we have, and it suggests that employer access to criminal history information displaces statistical discrimination against African American males. There is noisier research out there, which tries to determine what effects interstate variation in the availability of criminal history records have on employment, but the results are preliminary, ambiguous, and many of them have not yet survived peer review. It

\textsuperscript{31} Id. at 16.
\textsuperscript{32} Id. at 18.
\textsuperscript{33} Id. at 19.
\textsuperscript{34} The Legal Action Center index of Internet availability that both authors use is no longer available on the Center’s web site.
\textsuperscript{35} See https://watch.wsp.wa.gov/.
therefore seems appropriate to tentatively accept Holzer et al.’s findings as the current state of the art, while recognizing that future economic research will shed more light on this important question and could prompt reconsideration.

B. Government Information Policy as a Supplement to Antidiscrimination Law

Given the deleterious consequences of the employer behavior that Holzer et al. find, it is worth examining the possible avenues, other than ex-post litigation, for the state to prevent statistical discrimination. One way to protect African Americans and other disadvantaged groups would be to make them appear indistinguishable from whites. Indeed, some efforts to reform antidiscrimination law have suggested that statistical discrimination can be mitigated if the relevant decisionmakers are deprived of information about a candidates’ race, religion, or gender. With less information, decisionmakers presumably will focus more on the black and white of a job applicant’s resume, and less on the black or white of the applicant’s skin. Related efforts, such as the Racial Privacy Initiative that was defeated at the polls in California in 2003, ostensibly sought to decrease racial discrimination by prohibiting the government from collecting information about individuals’ race, so that the government could not disseminate that information at a later date or act upon it.37

In the information age, we should consider approaching the statistical discrimination problem from the opposite direction: using the government to help provide decisionmakers with something that approximates complete information about each applicant, so that readily discernable facts like race or gender will not be overemphasized and more obscure but relevant facts, like past job performance and social capital, will loom larger.

For example, the government might subsidize the creation of information clearinghouses, so that employee evaluations from prior employers can be aggregated in

37 For an interesting discussion and critique of this initiative, see Anita L. Allen, Race, Face, and Rawls, 72 Fordham L. Rev. 1677, 1686-96 (2004).
one place; it might use tax incentives to encourage the collection of 360 degree feedback about employees within firms, so that one boss’s negative opinion of a former employee is not given too much weight; the state might publish information about all individuals’ involvement (or lack thereof) in the criminal justice or bankruptcy systems; it might publish military records that document individuals’ performance and conduct while in the service; or it might verify and vouch for applicant’s educational credentials.38

On this theory, a major factor driving unlawful discrimination on the basis of race, ethnic status, gender, or religion is a lack of verifiable information about the individual seeking a job, home, or service. By making the publication of criminal histories tortious,39 restricting the ability of information data brokers to disseminate information about individuals,40 or raising the media’s costs of obtaining aggregated criminal history information that is already in the government’s hands,41 information privacy protections undermine antidiscrimination principles. The tradeoff makes privacy

---

38 Richard Epstein notes in passing the desirability of such efforts, and complains that antidiscrimination law sometimes thwarts them. RICHARD EPSTEIN, FORBIDDEN GROUNDS: THE CASE AGAINST EMPLOYMENT DISCRIMINATION GROUNDS 40 (1992) (“The strategy of law should be to encourage employers to obtain as much individual information as possible about workers so that they can, pro tanto, place less reliance on broad statistical judgments. To the extent, therefore, that the present antidiscrimination law imposes enormous restrictions on the use of testing, interviews, and indeed any information that does not perfectly individuate workers, then by indirect it encourages the very sorts of discrimination that the law seeks to oppose.”). In addition to developing Epstein’s insight in far more detail, my analysis differs from his in two important respects. First, I identify ways in which the government can now affirmatively gather and publish information about individuals as a means of combating statistical discrimination. Second, whereas Epstein favors the repeal of antidiscrimination laws, see id. at 3, I support their continued enforcement, but view government information policy as a useful supplement to them. See, e.g., Lior Jacob Strahilevitz, Information Asymmetries and the Rights to Exclude, 104 Mich. L. Rev. 1834, 1889-94 (2006); cf. Strauss, supra note , at 1641-42 (“[S]tatistical discrimination can be reduced if employers are provided with reliable information about employees. This should be a principal objective of any regulatory regime in this area. Ordinarily, one excellent way to learn about an employer’s qualifications is to hire him or her.”).

39 See, e.g., Briscoe v. Reader’s Digest, 483 P.2d 34 (Cal. 1971); Melvin v. Reid, 297 P. 91 (Cal. 1931).

40 This was one result of the FTC’s actions following the ChoicePoint data privacy breach. ChoicePoint got into hot water after identity thieves signed up as its customers and obtained a wealth of financial data concerning individuals. Pursuant to a consent decree, ChoicePoint agreed to begin checking the credentials of its customers, visiting their places of business, and auditing their practices. See United States of America v. ChoicePoint Inc., Consent Decree (N.D. Ga. 2006), available at http://www.ftc.gov/os/caselist/choicepoint/0523069stip.pdf (visited June 29, 2007). Subsequently, ChoicePoint stopped doing business with small companies, and began doing business exclusively with large firms. See Aviva Litan, Case Study: ChoicePoint Incident Leads to Improved Security, Others Must Follow, Gartner RAS Core Research NOTE 600142771 (Sep. 19, 2006), available at http://www.choicepoint.net/news/choicepoint_1996.pdf

41 See, e.g., United States Dept. of Justice v. Reporters Committee for Freedom of the Press, 489 U.S. 749 (1989) (holding that criminal rap sheets are exempt from disclosure under FOIA because their dissemination would constitute an unwarranted invasion of personal privacy).
law and institutional arrangements that obscure information about individual’s reputations far more problematic than courts and theorists presently suppose.

II. Pragmatic Concerns

Governmental disclosures of previously private information will substantially enhance antidiscrimination strategies when two basic conditions are satisfied. First, statistical discriminators must significantly outnumber animus-based discriminators. Second, the information that the government is disseminating must be relatively accurate.

A. Animus Based Discriminators

The problem of pretext is daunting in the antidiscrimination context. A decisionmaker adopts a policy because it has a discriminatory effect, and then insists that the policy is actually motivated by benign considerations. Sorting among the pretextual and legitimate justifications for such a policy is one of the more difficult tasks faced by courts adjudicating discrimination claims. But there are limits on the extent to which an intentional discriminator can hide behind a nondiscriminatory rationale.

Information constraints provide one such limit. If the only thing a decisionmaker knows about a job or apartment applicant is his race, then it is quite difficult to identify a nondiscriminatory basis for excluding him. If, on the other hand, the decisionmaker has a wealth of information about an applicant, then it will be easier to identify some seemingly neutral characteristic that formed the basis for exclusion. As long as the decisionmaker can remember to exclude contemporaneous applicants who have that same characteristic, the decisionmaker likely will be able to convince the court that there was a non-pretextual basis for exclusion.

Recall that this paper is premised on the idea that animus-based discrimination is less prevalent than statistical discrimination. Yet there are surely still many decisionmakers who are motivated by animus, and it is possible that this form of

discrimination remains more prevalent in some contexts. Where animus-based discrimination predominates, a government strategy to provide decisionmakers with more previously private information about job applicants, apartment seekers, jurors, or students will make it easier for decisionmakers to rebut allegations of pretext. In those settings, the gains from decreased statistical discrimination often would be exceeded by the losses associated with easier animus-based discrimination.

B. False Information

Efforts to combat statistical discrimination via government information policy will only accomplish laudable objectives to the extent that the information disseminated is accurate. Some of the information discussed herein – military records, records of criminal convictions, bankruptcy records, immigration and naturalization documents, and the like – will not pose unmanageable accuracy problems. To be sure, any system that relies on the government to produce accurate information will produce errors, but perhaps the best way to detect and correct those errors will be to make the information available to the privacy subjects, as the European Union has done, so that the subjects of the information can dispute inaccuracies. To the extent that more stubborn errors occur, they will often resolve around cases of mistaken identity, where someone sharing the same name as another person with an undesirable characteristic is thereby penalized. These problems can be ameliorated through the use of supplemental identifiers other than names, such as birthdates, birth places, and partial Social Security Numbers. And the related problem of identity theft can be addressed through a combination of criminal enforcement and increased reliance on photographs, fingerprints, retinal scans, and other

---

43 The issue of implicit bias adds further complexity, as a decisionmaker may be acting on the basis of animus but not realize he is doing so. See Moran, supra note 7, at 907-10. For the purposes of this paper, conscious animus-based racism and implicit bias should be grouped together.

44 I use the word “often” here, rather than “invariably,” because of the possibility that increased reliance on reputational information will facilitate automated decisionmaking, which could in turn employ algorithms that draw decisionmakers away from the influences of animus. This argument is made in Tal Z. Zarsky, “Mine Your Own Business!: Making The Case for the Implications of the Data Mining of Personal Information in the Forum of Public Opinion, 5 Yale J.L. & Tech. 4, § II.B (2003).

45 See, e.g., European Directive on the Protection of Personal Data 95/46/EC Article 12

46 This is a recurring problem with the Department of Homeland Security’s no-fly and restricted lists. See also Kleysteuber, supra note 36, at 1358-59 (discussing this problem in the context of tenant information databases).
verification technologies. These tradeoffs are familiar: Decreased privacy buys us a reduction in individuals being subjected to inappropriate treatment.

The more daunting false information problems arise in the context of data that is not contained in existing public records, but rather is the product of government efforts to facilitate wider availability of information about individuals. For example, if the government does try to improve the efficiency of the labor market by subsidizing the collection of 360 degree feedback and making that feedback transportable across firms, then it will have to deal with deliberately or unintentionally false feedback that employee A provides about employee B. Critically, if an employer relies heavily on co-worker evaluations in deciding not to hire a seemingly qualified applicant, but those evaluations are themselves the product of co-worker animus or implicit bias, then the government strategy might be counterproductive.47

Nobody believes that the inaccurate feedback problem can be solved entirely in reputation-tracking environments. But, as I have written elsewhere, there are strong reasons to believe that the problems can be ameliorated significantly through the use of algorithms designed to locate outlier data points, along with spot-checks and audits relying on objective verification.48 Given enough information, these algorithms can identify instances where an individual provides suspiciously high levels of negative feedback toward members of an identifiable racial or gender group. Once identified, the system can then adjust the weight assigned to such feedback, substantially offsetting the harm done by feedback that is tainted by animus or implicit bias.

It is sometimes tempting to use the imperfections in feedback systems as a basis for rejecting their use. But the appropriate contrast is not between a world of perfectly accurate information about individuals and the sometimes flawed information that can be generated by an eBay-style reputation tracking mechanism. There are massive false feedback problem equivalents in the real world. A poor man buys one expensive suit to appear prosperous. A debt-saddled person drives a very nice car or eats at really nice

restaurants to appear well off. A middle aged person has plastic surgery to appear young. An individual fakes an accent to appear worldly. A would-be adulterer removes a wedding ring to appear unmarried. Reputation tracking systems like eBay’s, Slashdot’s, TripAdvisor’s, and Digg’s introduce some false feedback, but because most providers of feedback are sincere, and algorithms can help the purveyors or users of these sites weigh more heavily the feedback provided by reviewers who have proven their reliability, their signal to noise ratios are often quite high.

III. Normative Considerations

In this part I will touch upon some of the normative decisions that will help determine at what point society should embrace the sorts of policy options developed herein. As the reader will quickly discern, this section takes the objectives of existing antidiscrimination law as a given, and asks what information dissemination policies should follow from that premise.

A. When Is Government Publicity for Previously Private Information Desirable?

The preceding discussion suggests that it may be desirable for the government to facilitate the availability of previously private information about individuals so as to prevent statistical discrimination on the basis of suspect classifications. The implicit normative assumption is that if decisionmakers are going to try to exclude people with undesirable characteristics – criminal records, say – it is better that they identify those with criminal records using accurate criminal history information than via a less reliable and more troubling proxy for criminal backgrounds, such as race or gender. Employment discrimination against those with criminal records may have social costs, but it has social benefits as well, and the decision to tolerate such discrimination, be it in housing, employment, or educational settings, presently commands broad societal support.

There will be other “undesirable” but unobservable characteristics where the social consensus is quite different. Take, for example, HIV-positive status. HIV positive individuals are protected against discriminatory treatment by antidiscrimination laws. Yet some employers may still prefer to keep HIV-positive individuals out of their
workplaces, for reasons rational (e.g., concerns about rising group health insurance premiums) or irrational (stubborn concerns about the possibility of HIV transmission via casual contact). In the United States, the HIV virus historically has been disproportionately prevalent among homosexual men, with male-to-male sexual contact remaining the predominant method by which HIV positive Americans contracted the disease.\(^49\) In recent years, infection rates have risen particularly sharply among African Americans.\(^50\)

Given the substantial stigma associated with HIV and the relatively high costs of providing health insurance for HIV-positive employees, it is likely that homosexual men and African Americans generally are victimized by statistical discrimination designed to keep HIV positive individuals out of the workplace. One possible strategy for combating this statistical discrimination would be to publicize the HIV status of every American. That would be a bad idea. As demonstrated by the Americans with Disabilities Act, and a number of common law decisions treating HIV status as a “private fact” whose disclosure is highly offensive to a reasonable person,\(^51\) Americans have decided that HIV status itself ought to be a protected classification, and decisions classifying individuals on the basis of HIV status may be as bad, or nearly as bad, as decisions classifying them on the basis of race. Indeed, the current absence of antidiscrimination protections for homosexuals (at least under federal law) suggests that disclosing HIV status to prevent statistical discrimination against gays would be perceived as swallowing the spider to catch the fly. Involvement in the criminal justice system is a very different attribute than HIV status, and courts recently have become less sympathetic to privacy claims involving the dissemination of the plaintiff’s criminal history.\(^52\)

Rev. 755, 762-63 (2005); but cf. Norris v. King, 355 So.2d 21, 23-25 (La. App. 1978) (reaching a contrary result, but relying
In short, when existing laws and norms tolerate the publication of information about an individual’s attributes, and when in the absence of such information decisionmakers may statistically discriminate using a legally suspect classification system, the government should publish the information in question or facilitate its widespread availability. But the government should not publish information showing who is a member of a protected class, such as HIV patients, pregnant women, Mormons, and the like, even if the resulting statistical discrimination reduces the opportunities available to HIV-negative homosexual men, non-pregnant women, or non-Mormon residents of Utah.

B. Incidence

The discussion so far has been premised on the idea that it is desirable to help law-abiding African American males at the expense of African American males with criminal records. To defend that proposition, it is worth exploring the counterarguments—namely, why someone might want to make it more difficult for private decisionmakers to sort among those with criminal records and those without criminal records. There are several possible justifications for this approach. First, we might expect that those with criminal records will be harmed more than those without criminal records will be helped. Accordingly, facilitating effective private sorting will make job applicants as a whole worse off. Second, we might believe that there are powerful policy justifications for preventing sorting, perhaps because we believe that criminals who have served their time deserve a clean slate. Third, we might believe that the criminal justice system is essentially corrupt, in which case facilitating sorting merely enhances the unjust penalties meted out by an arbitrary government apparatus. Of these three arguments, only the last one has significant force. I will consider them in turn.

First, the best available empirical evidence suggests that African American males are more likely to be hired by firms that conduct criminal background checks than by similarly situated firms that do not. Recall that Holzer and his co-authors found that those responsible for hiring appeared to overestimate the propensity of African American males

on a California precedent that Gates overruled). The Supreme Court held decades ago that it was not unconstitutional for the government to disseminate information about a shoplifter’s prior arrests. See Paul v. Davis, 424 U.S. 693, 713 (1976).
to have criminal records, and hire too few African Americans as a consequence.\textsuperscript{53} Publicizing accurate information about individuals’ involvement in the criminal justice system should only adversely affect a group’s available opportunities to the extent that decisionmakers (a) underestimate the prevalence of criminal records among members of a particular group, or (b) are effectively prevented from engaging in statistical discrimination to sort out those with criminal records. The Holzer study undercuts both claims, though some of Finlay’s unpublished research supports the former claim.

Alternatively, we might think that private sorting creates negative externalities, and justify keeping criminal histories obscure for that reason. For example, we might believe on policy grounds that the availability of employment opportunities for ex-cons will discourage recidivism. Alternatively, we might have an abstract ideological commitment to the proposition that “everyone deserves a second chance,” or, more narrowly, that “someone who has served his time has repaid his debt to society and should be able to start off with a clean slate.” These sorts of arguments sometimes find their way into the information privacy case law and academic literature.\textsuperscript{54} In this case, the appropriate question to ask is what is the optimal strategy for preventing these negative externalities. We can answer this question by drawing on the tools of optimal redistribution analysis.

The appropriate way to facilitate the hiring of ex-cons who deserve a second chance is through direct subsidies to employers who hire them. Such programs have been implemented, with the discontinued federal Targeted Jobs Tax Credit providing one example\textsuperscript{55} and the current federal tax code’s Work Opportunity Credit providing another.\textsuperscript{56} Implicit tax subsidies to organizations whose missions involve reintegrating

\textsuperscript{53} Holzer et al., supra note 15, at 474; see also Holzer et al., supra note 8, at 227 (“[E]mployers may overestimate the average of incidence of prior conviction among blacks, owing to prejudice or a general lack of experience with black employees.”).

\textsuperscript{56} 26 U.S.C. § 51(D)(1)(c)
ex-offenders back into the social and economic mainstream would work similarly well.\textsuperscript{57} Alternatively, we can envision government programs to insure employers against the possible downsides of hiring ex-offenders. Because it is inexpensive for the government to identify ex-cons, the government can efficiently ensure that only genuine ex-cons benefit from the subsidized second chances. And since the tax subsidy or insurance programs would be funded out of general tax revenues, the costs of promoting second chances is borne by taxpayers as a whole. Compare that regime to the status quo. We try to facilitate the hiring of ex-cons by raising private decisionmakers’ costs of sorting between ex-cons and those with no criminal records. As a result, many employers evidently use statistical discrimination tools to penalize non-ex-cons, and the ex-cons who do get hired are likely to be members of groups whose baseline offending rates are low – white males, and females of all races. Under the present system, only some of the beneficiaries of the existing “promote second chances through information obscurity” program are actually ex-cons, and the costs of this policy fall heavily on a group that includes other ex-cons and innocent people who share demographic characteristics with ex-cons. From an optimal redistribution perspective, no one should prefer our present approach to a tax credit.\textsuperscript{58}

There are persuasive philosophical justifications for rejecting information policy as a tool for promoting the rehabilitation of ex-offenders as well. First, to the extent that ex-offenders are to be reintegrated into the workforce, we ought to prefer consensual integration over non-consensual integration. Publicizing the identities of ex-offenders and then providing subsidies to their employers will ensure that employers enter into these employment relationships willingly, rather than carelessly or via trickery. Initiating an employment relationship on the basis of an omission or misrepresentation hardly seems like a productive way to facilitate lasting trust and fidelity. If the employment relationship heads south, the employer will feel burned and will be more vigilant about screening out ex-offenders next time via criminal background checks or statistical discrimination. Second, as a matter of principle, it seems that the law should reveal

\textsuperscript{57} The Delancey Street Foundation is a particularly successful example of this type of organization. See <http://www.eisenhowerfoundation.org/grassroots/delancey/>.\textsuperscript{58} Notably, this sort of analysis is absent from Steven Raphael’s recent essay on the subject. See Raphael, supra note 23, at 515.
troubling inequalities, so that their root causes can be addressed by policymakers and the citizenry. Suppressing information about such inequality, or even failing to facilitate its disclosure, might reduce the chances that the underlying inequalities will be remedied.

The final justification for obscuring information about criminal offenses is connected to disturbing inequalities within the criminal justice system. More precisely, if the criminal justice system is systematically biased against African Americans, Latinos, or men, then a system whereby the government publicizes the crimes of African Americans, Latinos, and men will worsen existing inequality. This argument comes the closest to providing a compelling reason for suppressing criminal history information about individuals. If criminal punishments are indeed meted out arbitrarily to members of minority groups, then a Rawlsian should reject the proposal that I have advanced, though a welfarist should not.

If we accept a softened version of the “arbitrary criminal justice system” thesis, then we certainly need not reject the approach defended here. More precisely, even in a nation whose criminal justice system discriminates systematically against African American males, there may be important, merit-related differences between those African American males who have criminal records and those who do not. Some of the former will be innocent, but surely virtually all of the latter will be innocent.

IV. Conclusion or: How I Learned to Stop Worrying and Love Megan’s Law

This paper reflects a shift in my thinking about government information policy. I began as a skeptic of Megan’s Law, the computerization of bankruptcy records, and other policies whereby the government made previously private information freely available to the public. But I have increasingly begun to appreciate the potential for these sorts of policies to further social welfare and combat morally problematic statistical discrimination. Employers, by and large, are not going to want to hire sex offenders, and banks, by and large, are not going to want to lend to people with bad credit (at least not without charging subprime rates). If the government fails to provide employers and lenders with information that will enable them to sort out the sex offenders and the

bankruptcy filers, then these employers and lenders will be tempted to rely on unlawful, but difficult to detect, statistical discrimination techniques to screen out the undesirables. Such subtle statistical discrimination is often more troubling that overt discrimination on the basis of criminal or bankruptcy history, and this analysis shows a myriad of related government strategies for stomping it out. In short, government information policy stands as a useful, and perhaps even necessary, supplement to the antidiscrimination laws’ attack on statistical discrimination.

The problem, then, with Megan’s Law and Internet availability of bankruptcy filings, is not that they reveal too much, but that they reveal too little. Such online resources should be expanded to include all criminal convictions of adults, as Colorado, Florida, and a handful of other states have done, and more documents pertaining to individuals’ financial distress. Indeed, much of the information in the federal government’s National Crime Information Center’s (NCIC) database could be brought on-line, made available to the general public free of charge. If positive spillovers result from the reintegration of ex-offenders or ex-insolvents into the nation’s economic and social life, and I suspect they do, then direct subsidies or insurance programs, not information privacy protections, are the appropriate policy lever for facilitating that reintegration.
