How the Fourth Amendment and the Separation of Powers Rise (and Fall) Together

Aziz Z. Huq†

This Essay explores the purposive and functionalist parallelisms between the Fourth Amendment and the separation of powers. Not only do those two elements of the Constitution share a common ambition, they are also entangled in practical operation. The vindication of Fourth Amendment interests, however defined, depends on institutional differentiation between branches of government. That institutional predicate, however, has eroded over time. In its absence, new questions arise about how Fourth Amendment values are best implemented and whether their realization is better attained by private rather than state action.

INTRODUCTION

This Essay tenders two claims about how the Fourth Amendment and the separation of powers interact. First, the Fourth Amendment echoes in purpose, and relies on in practice, the division of authority between the three branches of the federal government. Second, the institutional predicates of the Fourth Amendment’s operation with respect to the federal government are incentive-incompatible and therefore unreliable. The ensuing erosion of the amendment’s underlying institutional predicates has implications, I suggest, for the viability of efforts to promote pro-privacy regulatory agendas under a constitutional aegis, and, as a correlate, the need to find possible alternative regulatory paths to privacy in new regulatory spaces such as emerging digital and telecommunications domains.

My focus departs from mainstream Fourth Amendment scholarship’s current preoccupations. Since the 1960s, the latter

has focused on the scope of police authority, especially regarding the power to conduct vehicular stops and street stop-and-frisks, the measure of deference to officer safety in traffic stops, the need for an exclusionary rule, and the boundary between a diffuse reasonableness trigger for search authority and a more procedurally onerous warrant requirement. The Supreme Court’s Fourth Amendment docket in the 2015 term is exemplary in turning on vehicular stops\(^1\) and municipal investigations.\(^2\)

This focus obscures the relationship of the Fourth Amendment to the structure of the federal government. It also means that the Court typically considers Fourth Amendment questions concerning novel technologies in litigation about ordinary policing. The consideration of geolocational technologies and cell-phone data in United States v Jones\(^3\) and Riley v California,\(^4\) for instance, emerged respectively from narcotics\(^5\) and antigang investigations.\(^6\) But Fourth Amendment rules tend not to be tailored to specific institutional contexts. They spill over to the federal government’s rather different search capacities.\(^7\) Judicial preoccupations peculiar to the policing and crime-control contexts nevertheless infuse (or distort) conduct rules and remedies that extend undifferentiated across distinct institutional contexts.

To be sure, the Fourth Amendment and the separation of powers have been recoupled in the public eye by the sheer force of recent events. Disclosures of warrantless surveillance by the NSA\(^8\) and telephony-metadata collection\(^9\) have catalyzed wide-ranging[RT: MW] debate on data-collection and surveillance authorities. The separation of powers figured into this debate because initial administration defenses of surveillance programs

How the Fourth Amendment

rested on an assertion of plenary Article II authority. Such claims prompted predictable objections and defenses based on constitutional text and practice. This literature, while informative on its own terms, trains narrowly on the distribution of power between Article I and Article II. It does not consider what the Fourth Amendment implies about the distribution of interbranch authority. Nor does it reflect on the fit between the institutional assumptions underwriting the Fourth Amendment and observed institutional behavior.

To be clear, my aim here is not to ascertain whether specific collection or surveillance programs are lawful or constitutional. The evaluandum in this Article is rather the separation of powers as a device for promoting rights. There is a largely optimistic body of literature that considers causal links between constitutional structure and individual liberties. Hence, Professors Nathan Chapman and Michael McConnell elaborate an account of the Due Process Clause pursuant to which the “government may not interfere with established rights without legal authorization and according to law, with ‘law’ meaning the common law as customarily applied by courts and retrospectively declared by Parliament.” In similar terms, Professor Heather Gerken posits that “the ends of equality and liberty are served by both rights and structure.” I am less certain. My aim is to define

12 See, for example, Gary Lawson, What Lurks Beneath: NSA Surveillance and Executive Power, 88 BU L Rev 375, 383–91 (2008) (arguing that the “Vesting Clause thesis is . . . obviously true” and that “[i]f the Vesting Clause thesis is correct, the Bush Administration’s NSA program as it has been described by the Administration appears to be lawful”)[SP].

13 See generally, for example, Neal Katyal and Richard Caplan, The Surprisingly Stronger Case for the Legality of the NSA Surveillance Program: The FDR Precedent, 60 Stan L Rev 1023 (2008) (examining the surveillance activities undertaken by President Franklin D. Roosevelt and their similarities to modern practices).

16 See Aziz Z. Huq, Libertarian Separation of Powers, 8 NYU J L & Liberty 1006, 1012 (2014) (“[T]he analysis of structural constitutional design proves only ambiguous and fragile guidance [as to how to promote normative interests].”)[SP].
here how constitutional structure, viewed ab initio, was intended to promote a specific right, and to analyze the extent to which this structure-rights causal nexus remains robust today. By testing whether constitutional structure does promote Fourth Amendment rights as originally intended, I move beyond the relatively abstract causal claims aired in this literature and provide a more grounded case study in constitutional design.

The argument has three steps. Part I maps three pathways between the Fourth Amendment and the division of interbranch authority—a common purpose and two common assumptions about institutional differentiation. Part II considers whether these linkages have withstood the test of time. It finds a lag between the Fourth Amendment’s aspirational political economy and observed institutional behavior. Part III then draws inferences for future doctrinal development and privacy-seeking strategies, with particular attention to how Fourth Amendment values can be vindicated given aggressive federal collection, analysis, and surveillance efforts regarding electronic communications.

I. THE FOURTH AMENDMENT’S IMPLICATIONS FOR THE SEPARATION OF POWERS

This Part identifies three pathways between the Fourth Amendment and the separation of powers. Its aim is to loosely sketch how rights against unreasonable searches and seizures might have fit into the larger constitutional architecture and to articulate a structural account of the Fourth Amendment.\textsuperscript{17} I contend first that a common purpose animates both elements of the Constitution. Further, I suggest that the practical operation of Fourth Amendment values assumes two forms of institutional differentiation embedded in the separation of powers. For each argument, I use text and history as departure points. I recognize that the Fourth Amendment’s text and history remain sharply contested.\textsuperscript{19} Still, I hope my argument rest on tolerably uncontroversial, shared grounds.

\textsuperscript{17} For one explanation of structural arguments, as opposed to other types of constitutional arguments, see Philip Bobbitt, Constitutional Fate: Theory of the Constitution 74–92 (Oxford 1982). Professor Philip Bobbitt describes “structural arguments” as “largely factless” and as relying on “inferences from the existence of constitutional structures and the relationships which the Constitution ordains among these structures.” Id at 74.

\textsuperscript{19} For example, compare Thomas Y. Davies, Recovering the Original Fourth Amendment, 98 Mich L Rev 547, 724 (1999) (arguing that the Fourth Amendment was
How the Fourth Amendment

The basic premise of all three points advanced here is commonplace: the Fourth Amendment initially applied to the federal government alone.20 The Court incorporated protections against unreasonable searches and seizures against the several states only in 1949.21 Further, police forces (as the term is employed today) did not exist in 1791.22 They would not come into existence for another half century.23 As a result, “the ex officio authority of the peace officer was still meager in 1789.”24 The class of federal officials of the early republic most often invoked as potential violators of the Fourth Amendment comprised naval inspectors exercising statutory authority to search, either with or without a warrant, for customs violations.25 At the moment of its entry into legal force, therefore, the Fourth Amendment reached governmental behavior distinct in scale and topography from its contemporary analog. Connections to the separation of powers must be glossed in light of that gap.

aimed “at banning Congress from authorizing use of general warrants”), and Telford Taylor, Two Studies in Constitutional Interpretation: Search, Seizure and Surveillance and Fair Trial and Free Press 19–416 (Ohio State 1969) (“concluding that “our constitutional fathers were not concerned about warrantless searches, but about overreaching warrants”)[SP], with Akhil Reed Amar, Fourth Amendment First Principles, 107 Harv L Rev 757, 758 (1994) (arguing that the Amendment “require[s] that all searches and seizures be reasonable”); Silas J. Wasserstrom, The Incredible Shrinking Fourth Amendment, 21 Am Crim L Rev 257, 258 (1984) (describing the “conventional interpretation” of the Fourth Amendment as including a “warrant requirement” for nearly all searches and seizures).

20 See, for example, Akhil Reed Amar, The Bill of Rights as a Constitution, 100 Yale L J 1131, 1136 (1991) (describing the Bill of Rights as “[o]riginally a set of largely structural guarantees applying only against the federal government”)[SP].

23 See id at 1204. See also Stephanos Bibas, The Machinery of Criminal Justice 15–16 (Oxford 2012).

25 See, for example, Act of Mar 3, 1791, § 32, 1 Stat 199, 207 (authorizing issuance of warrants to customs enforcement officials to find “fraudulently deposited” spirits); Akhil Reed Amar, Fourth Amendment First Principles, 107 Harv L Rev 757, 766 (1994) (collecting early statutes that allowed customs searches without warrants). See also Boyd v United States, 116 US 616, 623 (1886) (noting that an exemption for customs inspectors was granted “by the same Congress which proposed for adoption the original amendments to the Constitution,” indicating that “the members of that body did not regard searches and seizures of this kind as ‘unreasonable’”)[SP].
A. Common Purpose

Constitutions—including the US iteration of 1787—strive to achieve many ends, from the creation of new state infrastructure to the settlement of regional divides to the fostering of public goods such as a robust internal economy or national defense. Not all unfold in the same time frame. Some may be long-term; others have close temporal horizons. In consequence, it cannot be assumed that distinct constitutional provisions, introduced at different moments in historical time for different reasons by heterogeneous constituencies, will have the same or congruent ends.

Nevertheless, the Fourth Amendment and the 1787 separation of powers pursue a common end. Trivially, both are concerned with constraining, not empowering, the state. More interestingly, though, they converge on a quite distinct problem of liberal state building: the avoidance of what Montesquieu called “despot[ism]” and James Madison labeled “tyranny.” Both endeavored to raise the costs of attempts by those with political authority to consolidate state power absolutely against contemporaneous or prospective opponents. The separation of powers achieves this end by preserving the platforms from which opponents and newcomers can sustain their positions in political competition. The Fourth Amendment, in contrast, focuses on the potential for incumbents to deploy state power to undermine the persons and reputations of those same opponents. By providing a positive entitlement to platforms for political opposition and a negative entitlement against ill-motivated efforts to undermine those platforms, these two elements of the Constitution work in complementary motion.

[27] I have identified elsewhere an intertemporal tension between different ends sought by the 1787 Constitution. See Aziz Z. Huq, The Function of Article V, 162 U Pa L Rev 1165, 1229 (2014) (identifying elements of a constitution as “temporally sensitive” due to “exogenous pressures on the nation-state”).

To Montesquieu and Madison, a central task of constitutional design was aversive in character: avoiding concentrations of power that might conduce to arbitrary rule. Montesquieu identified despotism with regimes in which “the law must be in a single person[,] and it must change constantly,” and he condemned them as “corrupt by nature.” In response, he pressed the utility of intermediating entities—in particular the judiciary. His cure for despotism thus adhered to institutional heterogeneity. Elaborating on Montesquieu’s argument, Madison rejected a complete separation between the branches. Rather, he underscored the French nobleman’s dictum that “where the whole power of one department is exercised by the same hands which possess the whole power of another department, the fundamental principles of a free constitution are subverted.” Institutional monopolization of state power, in Madison’s account of the Constitution, was resisted not only by a constitutional design in which “each department [had] the necessary constitutional means, and personal motives, to resist encroachments of the others” but also by the installation of a “double security” of vertical separation between the national and state governments. Absent the differentiation of interests across institutions, of course, neither separation of powers nor federalism would have an inhibitory effect on despotism. But consistent with his insistence in Federalist 10 on the inevitability of manifold factional differences across the population, Madison’s vision of the separation of powers can be understood as a subsidy to the inevitable political opposition that arises in an extended, heterogeneous republic. This subsidy is a hedge against despotism and tyranny.

The Fourth Amendment advances the same end via different means. To see this, start with the two English cases that provided focal points as negative precedent in the ratification

debates: 39 civil actions by John Entick and John Wilkes, both opposition English politicians, against agents of Lord Halifax, the secretary of state. 40

Both Entick and Wilkes were targeted due to their political activities against those in power, and in particular due to publications that were critical of the Earl of Bute’s regime. 41 Explaining the legal questions in Entick’s suit, the presiding judge Lord Camden focused not on a flaw in the warrant but rather on the impermissibility of “paper search[es].” 42 Papers, he explained, were a person’s “dearest property[,] and are so far from enduring a seizure, that they will hardly bear an inspection.” 43

As Professor William Stuntz has elegantly argued, the rule of Entick v Carrington 44 and Wilkes v Wood 45—a rule against paper searches—had almost no bearing on the investigation of ordinary crimes in an era wanting for organized police, when citizens would make accusations and often effect arrests; it rather imposed a constraint on “political crime[s].” 46 In the eighteenth century, only senior government officials would have men at their disposal to search homes. A number of these searches would likely target papers implicating some kind of opposition to regnant powers. 47 Seditious libel prosecutions of this sort, with attendant investigations involving “general searches for documentary evidence,” had been common under King Charles I. 48 The Fourth Amendment, to the extent it drew inspiration and purpose from these cases, was thus “really about the protection of political dissent.” 49 In other words, it was about maintaining space for individuals to compete for offices created by the separa-

ration of powers system—individuals who might play vital roles in resisting incipient despotism.

B. Two Forms of Institutional Differentiation

There is no such thing as a purely private paper or thing. Nothing, as a matter of law, lies categorically beyond the panoptic gaze of government. But it was not always so. In its “first significant case involving the fourth amendment,” the Court held in Boyd v United States that any “seizure of a man’s private books and papers” would violate the Fourth (and Fifth) Amendment. Boyd rooted this absolute protection of private papers in a law office history of Wilkes. The ensuing class of “private” papers that could be neither seized by government agents nor secured by subpoena endured, at least in theory, until Boyd’s repudiation in 1976. Periodic calls for the revival of the Boyd rule aside, the Court itself currently evinces no appetite for trying to circumscribe some domain of absolutely private papers or things that under no circumstances can be elicited by the state.

But if the Fourth Amendment does not create a zone of unbreachable privacy, what does it do? The amendment does not entirely prohibit the government from engaging in searches or seizures—this much is evident from the adjective “unreasonable.” Rather, the amendment has generally been read as circumscribing the conditions under which such actions are lawful. In textual terms, the reasonableness of a search does not depend on its object or what it happens to discover but rather on the manner in which the government behaves. The Fourth Amendment

52 Id at 633.
53 See id at 625–26.
55 See, for example, Eric Schnapper, Unreasonable Searches and Seizures of Papers, 71 Va L Rev 869, 873–74 (1985) (describing the Boyd Court’s interpretation of En-tick as “more accurate” than later interpretations)[SP].
56 See Andrei Marmor, What Is the Right to Privacy?, 43 Phil & Pub Aff 3, 7 (2015) (identifying the primary interest at stake in the privacy debate as “the interest in having a reasonable measure of control over ways in which we present ourselves to others”).
57 See, for example, Boyd, 116 US at 622 (noting that “long usage, acquiesced in by the courts,” might legitimate a given search or seizure by suggesting that there must be “plausible ground or reason for it in the law, or in the historical facts”) [SP].
here diverges from other parts of the Bill of Rights, such as the Free Speech and Establishment Clauses of the First Amendment, which seem to be absolute prohibitions.\textsuperscript{58} It rather tracks the Takings Clause. This does not on its face reject all government confiscations but rather requires compensation and imposes limitations on the subsequent use of property.\textsuperscript{59} Like the Takings Clause, the Fourth Amendment assigns a price to the (coercive) work of statecraft.

The Fourth Amendment’s labor, though, operates along a subtly different margin from the Takings Clause’s. The former entails a careful division of institutional labor among all three branches, whereas the latter imposes a liability rule of just compensation without specifying its institutional underpinnings.\textsuperscript{60} The executive, of course, is implicated because it is the object of Fourth Amendment regulation. Treating that as a given, I examine here first its implicit allocation to legislators and then its mandate for judicial action to show the Fourth Amendment’s double functional dependence on the separation of powers.

1. Congress and the Fourth Amendment.

A world apart from the First Amendment’s gimlet-eyed stance toward legislators, the Fourth Amendment deploys Congress as a means to further individual interests. Consider the Warrant Clause, which imposes “probable cause, supported by Oath or affirmation” as a condition antecedent to the issuance of a warrant.\textsuperscript{61} The text supplies no referent for probable cause. But it is tolerably clear that a certainty that agents “will find something in a house—walls, for example— . . . cannot suffice to support an ex parte warrant.”\textsuperscript{62} As a post-Wilkes pamphleteer explained, an officer must possess probable cause respecting the presence of “stolen goods, or such a particular thing that is crim-
inal in itself . . . before any magistrate is authorized to grant a warrant to any man to enter [a] house and seize it.”63 The reference to probable cause, in short, is an incorporation by reference of substantive criminal law.

Congress accordingly enters the Fourth Amendment equation as a source of rules that calibrate search authority under warrants.64 A legislature concerned about executive abuse of search authority can narrow criminal liability to rein in the executive. A legislature lacking this concern, but worried about fiscal goals, can alternatively recruit inspectors and vest them with authority to engage in searches of vessels and homes for illegally imported goods.65 Of course, not all search authority turns on warrants. But, at least until recently, the Court has construed the authority to search or seize without a warrant in the case of felony arrests,66 vehicular searches,67 or street-level stops68 as keyed to the scope of substantive criminal law.

The Fourth Amendment’s allocation to Congress of the power to calibrate search authority has two advantages. It first diffuses control over a key element of government power between two branches. Second, it amplifies democratic control over such authority. From this perspective, Stuntz’s near-canonical objection to constitutional criminal procedure—that Congress can take away whatever the Court gives in the form of procedural rights by ratcheting up the severity and scope of substantive criminal law69—inverts the anticipated constitutional design.

The Fourth Amendment’s democratic pedigree is more consistent with the provision’s central antityranny purpose than Stuntz’s analysis might imply.

64 See Ku, 86 Minn L Rev at 1326 (cited in note 28).
65 See note 25 and accompanying text.
66 See, for example, United States v Watson, 423 US 411, 423–24 (1976) (declining to adopt a constitutional rule requiring warrants when it is not “practicable” to procure one during an arrest)[SP].
67 See, for example, Carroll v United States, 267 US 132, 155 (1925) (“[I]f an officer seizes an automobile . . . without a warrant . . . the officer may escape costs or a suit for damages by a showing that he had reasonable or probable cause for the seizure.”)[SP].
68 See, for example, Terry v Ohio, 392 US 1, 30 (1968) (permitting a police officer to conduct “a carefully limited search of the outer clothing” of a person if the officer “observes unusual conduct” indicating that “criminal activity may be afoot”)[SP].
There are two important caveats to this point. First, during the first decade of the republic, there was a “muddled” and highly politicized debate about whether a federal common law of crime existed. Riding circuit in 1798, Justice Samuel Chase rejected nonlegislative crime. Fourteen years later, the whole Supreme Court in *United States v Hudson and Goodwin* followed suit, holding that the “legislative authority of the Union must first make an act a crime, affix a punishment to it, and declare the Court that shall have jurisdiction of the offence.”

To rely solely on *Hudson and Goodwin* to show that criminal prohibitions required legislative action would, I think, be evasive. After all, prior to 1812, eight circuit courts had upheld convictions secured through common-law federal crimes. These judges may have been operating according to presumptions that had been ousted by the 1787 Constitution. But the logic of constitutional architecture is not so airtight or inexorable that elements of a repudiated ancient regime cannot survive, or even fester, as purported constitutional backdrops.

A more modest defense of my argument avoids prochronic feints. It holds that even assuming a federal common law of crime existed in 1791, Congress was hardly shut out of the picture. It surely remained to Congress to abrogate common-law crimes. Even absent a role in fashioning common-law crimes, Congress still held the whip hand over state search authority between 1791 and 1812.

The second caveat operates not as a limitation on my observation about the structural predicates of the Fourth Amendment but instead as an indictment of recent doctrinal developments. Since 1967, the Court has recognized a gamut of exceptions to both the warrant rule and any individuated-suspicion require-

---

71 See Stephen B. Presser, A Tale of Two Judges: Richard Peters, Samuel Chase, and the Broken Promise of Federalist Jurisprudence, 73 NW U L Rev 26, 68 (1978) (“Other commentators on the political dispute which was soon to develop over the existence of a federal common law of crimes attribute the division of opinion to the broader Federalist/Republican split over the extent of powers that the Constitution granted to the central government.”)[SP].

74 Id at 34.

ment in a series of cases now denominated administrative search jurisprudence. So, for example, police can establish witness checkpoints without a scintilla of legislative authorization. Foreign-intelligence investigations are another exception. Abandonment of individuated suspicion corresponds to a derogation of any necessary legislative role of the kind that the Framers anticipated. The administrative search doctrine has been comprehensively critiqued on other grounds, but it surely counts as a strike against that jurisprudence that it disregards what has long been a keystone element in the amendment’s institutional logic—a tight nexus to legislative authorization.

2. Courts and the Fourth Amendment.

To contemporary ears, an inquiry into the judicial function in Fourth Amendment law is no less than an inquiry into the much-maligned exclusionary rule of Mapp v Ohio (imposed, albeit in federal prosecutions, forty-seven years beforehand). But even in the absence of an exclusionary rule, the Fourth Amendment in practical operation necessitates institutional differentiation between the executive and judiciary. Before exclusion’s advent, therefore, courts were already necessary institutional channels of Fourth Amendment values.

The judicial role emerges in the Warrant Clause. To be sure, just as the text is silent as to the object of probable cause, so too it is silent on the identity of the constitutionally proper person to issue a warrant. But as glossed by the Court, the clause implies institutional differentiation between “the officer engaged in the often competitive enterprise of ferreting out crime” and “a neu-

76 See, for example, Camara v Municipal Court of the City and County of San Francisco, 387 US 523, 538 (1967) (concluding that area inspections for the purpose of enforcing municipal programs satisfy the criminal law standard of “probable cause” and do not violate the Fourth Amendment as long as “reasonable legislative or administrative standards for conducting an area inspection are satisfied”).

77 See Illinois v Lidster, 540 US 419, 427 (2004) (deeming a checkpoint stop constitutional because it “interfered only minimally with liberty of the sort the Fourth Amendment seeks to protect”)

78 See, for example, 50 USC § 1805(a)(2)(A) (providing special exceptions for electronic surveillance if “the target ... is a foreign power or an agent of a foreign power”[SP]).

79 Narcotics and alcohol checkpoints are loosely justified by legislative action in the sense that laws exist regulating controlled substances. But this is not the kind of tight nexus required by the probable cause requirement.

tral and detached magistrate.”82 Article III courts have the authority to issue warrants notwithstanding the ex parte character of those proceedings.83 But not all warrants need to be issued by Article III judges, provided that the magistrate possesses the “neutrality and detachment demanded of a judicial officer.”84 In practice, this entails institutional separation.85

This illuminates the otherwise rather puzzling result in Shadwick v City of Tampa,86 in which the Court upheld an ordinance authorizing arrest warrants issued by nonlawyer court clerks for breaches of municipal ordinances.87 Shadwick explained that the Fourth Amendment insists that “someone independent of the police and prosecution must determine probable cause”88 and looked to the institutional locus of the clerks rather than their training or tenure.89 For this reason, a non–Article III magistrate judge can issue a warrant,90 whereas an FBI special agent in charge, however competent, legalistic, and dispassionate, is disqualified by her presumptive “partiality, or affiliation,”91 with the investigating officers.

The Warrant Clause, in short, rejects a purely endogenous solution to the problem of ensuring regularity and legality within investigative agencies. It repudiates what administrative law scholars call “internal separation of powers” solutions for checking and diffusing government power.92 Such solutions involve intermural “administrative structures and other mechanisms” to promote due process, “regularity[,] and the rule of law”93 in a “fractal”94 effort to recreate within a branch structures that might otherwise operate between the branches.

85 See id at 327 (determining that there was no “neutral and detached posture” when the town justice that issued the search warrant constructively became a member of the police operation)[SP].

93 Id at 429.
The second judicial function within the institutional architecture of the Fourth Amendment cannot be drawn directly from the amendment’s text. Instead, it must be derived from the assumptions and beliefs that animated its incorporation into the Constitution. On Professor Akhil Amar’s account, the anticipated remedial mechanism for Fourth Amendment violations was a civil tort action for damages, in which an officer’s liability would be ascertained by a jury.\textsuperscript{95} To substantiate this claim, Amar identifies “strong linkages between the Fourth and Seventh Amendments,”\textsuperscript{96} with Entick and Wilkes as key exhibits.\textsuperscript{97} Indeed, seizures by federal revenue officials in the early republic were challenged in common-law forms of action such as trover, detinue, and assumpsit.\textsuperscript{98} Such suits were brought in either state or federal courts.\textsuperscript{99} But given that the Seventh Amendment’s right to a jury trial in civil cases had been motivated in part by Anti-Federalist concerns about unchecked federal official action,\textsuperscript{100} it seems plausible to think that some measure of institutional differentiation within the federal government was inferred from the expected operation of the Fourth Amendment.

C. Structural Implications of the Fourth Amendment

Constitutional rights have different shapes: in Hohfeldian terms,\textsuperscript{101} the Fourth Amendment is an individual right with a correlative duty on the state regarding the forms of permissible searches and seizures. The duty, rather than being substantive, has a structural, procedural declension. The Fourth Amendment is vindicated not by governmental disavowal of search authority but instead by assiduous observance of interbranch protocols. As befits a constitutional protection aligned in purpose with the separation of powers’ antityrannical ambition, the Amendment is cashed out by the involvement of multiple, clearly differentiated branches as conditions precedent to invasions on a person’s

sphere of protected interests. The Fourth Amendment as originally conceived rested on structural armatures.

II. TESTING THE FOURTH AMENDMENT’S STRUCTURAL IMPLICATIONS

But how have those foundations held up over time? This Part uses contemporary examples to illuminate interactions between the Fourth Amendment and the separation of powers. These examples are drawn from the domain of federal national-security-related surveillance, collection, and regulatory activities. The underlying hypothesis to be tested turns on whether fidelity to the separation of powers can indeed promote valued constitutional rights and individual liberties.

I offer a caveat first: The analysis presented here might be taken as endorsing a standard ambition in constitutional theory to “translate” the Fourth Amendment into contemporary contexts or to maintain an original “equilibrium.” But I am uncertain whether these metaphors enable perspicacious judgment—here, or ever. The sheer number of variables that have changed between 1791 and today means that it is hard to discern what a sound translation or equilibrium would be or how successful translations or equilibriums can be distinguished from failures. The sheer scale and expected social benefit of local and state government, and of the federal government, have changed dramatically but at different rates. How can an invariant Fourth Amendment rule covering all of them possibly embody and preserve a singular 1791 equilibrium? The range of human interests covered by the Fourth Amendment has also proliferated. Changes to domestic architecture and familial domiciliary arrangements, for example, have altered both the expectations and the possibilities of intimacy. Novel diversity in the permitted forms of sociability engender new interests. The advent of electronic surveillance, algorithmic data mining, and geolocational technology merely accentuates the wide variance in privacy interests. Hence, Professor Judith Jarvis Thomson’s famous complaint about the miscellaneous character of privacy resonates

as a critique of the Fourth Amendment’s scope and as a reprimand to mechanical notions of translation or equilibrium.

My goal here, instead, is more narrow than translation. It is to ask whether the anticipated causal mechanisms and effects associated with the Fourth Amendment continue to be observed today. The examples considered below document different elements of the contemporary interbranch division of labor as a way of testing the durability of the Founding-era assumptions. They are not fabular exercises in the academy’s just-so stories of translation or equilibrium.

A. A Domesticated Fourth Amendment?

The antityranny purpose of the Fourth Amendment finds exiguous echo in contemporary practice and doctrine. Viewed in the round, Fourth Amendment speak no longer treats dissenters (however defined) as the cynosure of constitutional protection. Rather, the overall structure of Fourth Amendment doctrine prioritizes a very different species of privacy.

To see this, consider who might be the closest contemporary analog to Wilkes. It is plausible (if not inevitable) to posit leakers such as Edward Snowden and their abettors at The Guardian and The New York Times as the closest parallels today: political insiders who rebelled in ways that other political insiders find morally and legally repugnant. Recent practice, though, suggests that the federal government is aggressive in investigating leakers and their abetting correspondents, and that the Fourth Amendment would provide very little shelter for either. This is in part because the instruments used to conduct such investigations, such as requests for call records and subpoenas, are weakly regulated under the Constitution. The attorney general’s guidelines titrating the use of subpoenas against news organizations stipulate that an order to produce information must be “essential” to a criminal investigation or prosecution. Given

106 At one presentation of this paper, an academic formerly employed by the federal government expressed sour disdain at this arguing, noting that Snowden, unlike Wilkes, was a government insider who betrayed a trust. Wilkes, of course, was also an insider (a member of parliament when North Britain No. 45 was published), protesting what he saw as the most iniquitous policies of the day. Contemporary contempt of Snowden, therefore, seems more probative of the historical parallel than disqualifying. The failure to see the parallelism—a failure that is, I think, quite widespread—is rather telling.

that in many cases a journalist’s records may be the sole place in which information about a leaker can be found, it is not clear how demanding this standard will prove.\footnote{109}

As a matter of Fourth Amendment doctrine, political dissenters also receive less protection than that afforded to suspects in more-routine investigations. The 1972 case United States v United States District Court for the Eastern District of Michigan\footnote{110} ("Keith") rejected warrantless searches that were directed at a group of domestic political dissenters.\footnote{111} But the Court invoked difficulties faced by investigators in domestic-security investigations to hold that the constitutionally adequate warrant procedure “may vary according to the governmental interest to be enforced and the nature of citizen rights deserving protection.”\footnote{112} Domestic-security cases could be channeled to specially constituted courts and regulated by less onerous timing and reporting rules. This “warrant lite” regime is potentially less protective than the post–World War II executive branch practice of permitting warrantless searches provided that their yield was not used in criminal prosecutions.\footnote{113} Congress has never taken up Keith’s invitation. The Keith opinion’s separate exception for foreign-power-related investigations,\footnote{114} it turns out, has generated quite enough leeway.

If there is a bias in Fourth Amendment law, it runs in quite a different direction. In Keith itself, Justice Lewis Powell adverted to “physical entry of the home [as] the chief evil against which the wording of the Fourth Amendment is directed.”\footnote{115} More generally, “the home [is] a sacred site at the ‘core of the Fourth Amendment’” across an array of situations.\footnote{116} In spite of

\footnote{109} Efforts to subpoena former New York Times report James Risen persisted for several months before Attorney General Eric Holder terminated them. Matt Apuzzo, Holder Fortifies Protection of News Media’s Phone Records, Notes or Emails, NY Times, Jan 14, 2015, at A18. Given the seeming centrality of Holder’s views on journalistic freedom to the decision here, it is not clear any general trend can be inferred from this decision.

its political, structural roots, the Fourth Amendment has transformed into a nostalgia subsidy for home ownership.\textsuperscript{117}

This transmigration of a public-regarding concept into a vindication of the cozily private is not unique. There is a little-noticed parallel between the Fourth Amendment’s domestication and the subsequent taming of the Second Amendment in\textit{District of Columbia v Heller}.\textsuperscript{118} The Second Amendment emerged from “conceptions of republican political order” that conduced to “ordinary citizens participat[ing] in the process of law enforcement and defense of liberty.”\textsuperscript{119}\textit{Heller}, however, reworked that right into one that is narrowly framed around self-defense.\textsuperscript{120} There is no small irony in the fact that perhaps the two most antistatist, centrifugal constitutional elements of the Bill of Rights have been rendered nullities on their original terms by domestication.

\section*{B. Congress as the Ally of Fourth Amendment Interests?}

Well-trodden examples illustrate how legislators are only weakly incentivized to vindicate Fourth Amendment values. The recent legislative response to Snowden’s disclosures, for example, was “hardly resist[ed]” by the NSA because it would entail merely “modest”\textsuperscript{\textbf{RT: direct quote}} changes to ongoing collection efforts.\textsuperscript{121} Similarly, the disclosures of warrantless bulk collection of domestic-to-foreign calls in 2005 resulted in new authorizations for bulk collection and retroactive immunity for telecommunications providers.\textsuperscript{122} Even the much-hymned Foreign Intelligence Surveillance Act of 1978\textsuperscript{123} (FISA) has glaring lacunae.\textsuperscript{124}

\textsuperscript{124} For example, FISA has an “exclusive means” provision, 50 USC § 1812b, but this extends to only “electronic surveillance.” The latter’s statutory definition, however, trains largely on wire communications inside the US, leaving satellite and other forms of transmission unregulated. §1801(f). The Wiretap Act also contains a savings clause that
\end{flushleft}
The threadbare quality of legislative incentives cannot be explained merely by Congress’s prioritization of security over privacy interests. Consider a less well-trodden example. Today, the usage of digital devices and services generates large volumes of by-product transactional, locational, and interational data.125 These data can be used to generate novel and surprising inferences about individual traits, behaviors, and affiliations.126 While the epistemic utility of aggregated data amenable to algorithmic analysis has stimulated considerable debate about the third-party doctrine of Smith v Maryland,127 few have noticed that data-rich intermediaries already have powerful incentives to share data with the government voluntarily, not least due to cyberattacks by other sovereign actors.128 Bills proposed in recent sessions of Congress and supported by major telecommunications carriers would deregulate information sharing between companies and the federal government, substantially lowering the cost of mass disclosures to the government.129 Recent iterations of these bills not only permit but affirmatively require real-time sharing of data received by the Department of Homeland Security with the NSA.130 The bills place no constraints on how data may be used. If the expansive and creative gloss placed on FISA’s “tangible things” provision131 or the deep cooperation between the Drug Enforcement Administration and AT&T in the

126 See, for example, Jones, 132 S Ct at 956 (Sotomayor concurring) (describing GPS monitoring as “making available at a relatively low cost [ ] a substantial quantum of intimate information about any person whom the Government, in its unfettered discretion, chooses to track”).
127 442 US 735 (1979). See also, for example, Jones, 132 S Ct at 957 (Sotomayor concurring) (“It may be necessary to reconsider the premise that an individual has no reasonable expectation of privacy in information voluntarily disclosed to third parties.”).

130 50 USC § 1861.
Hemisphere Project is any guide, such provisions will function as cheaper access channels for large data flows that otherwise would be regulated by warrants or administrative subpoenas. The strong legislative support for such measures suggests that Congress cannot be assumed to act as a friction on executive ambition even absent direct national-security concerns. Indeed, in contrast to legislative attitudes, the White House has promulgated an executive order with relatively robust privacy protections. This is not the sole pro-privacy posture struck by unexpected elements of the executive: In the early 2000s, the NSA endorsed robust cryptography and network-security algorithms, thereby ensuring their “wider availability in non-classified settings.” When the NSA was revealed to have corrupted commercial cryptography standards, another agency of the federal government, the National Institute of Standards and Technology, issued an advisory against the flawed algorithms. And one of the leading antisurveillance tools available today, the Tor network, was originally developed with the support of the US Naval Research Laboratory. Hence, even if Congress is routinely (if not inevitably) privacy blind, security-focused elements of the executive can be quite solicitous of the same value.

Elementary public-choice analysis suggests that these anecdotes will not be outliers but rather that congressional production of privacy protections will generally be weak, especially in the national-security domain. Many forms of surveillance have small effects that are diffused across the population. Consequently, they are unlikely to generate effective interest group formation. Even when government exploitation of vulnerabilities

---

133 See Executive Order 13691, 80 Fed Reg 9349, 9350–51 (Feb 15, 2015) ("Agencies shall coordinate their activities under this order with their senior agency officials for privacy and civil liberties and ensure that appropriate protections for privacy and civil liberties are incorporated into such activities.") [SP].
engenders possible criminal exploitation of the same weaknesses, the risk of economic loss is generally in the future, uncertain in distribution and magnitude, and highly discounted. To be sure, there is a minority (roughly one-quarter) of the population that highly values privacy, but (as I explain below) this minority may find the purchase of private substitutes easier than public collective action.

On the other hand, even though the harms combated by national-security institutions are uncertain and distant, they are vividly pressed by a powerful and prestigious legislative lobby—our law-enforcement and national-security agencies. The latter are especially influential among legislators because they influence the factual agenda for debate by determining how much information to share with Congress. The law-enforcement lobby, as the cybersecurity-information-sharing debate suggests, will also often align with influential telecommunications lobbies, whose financial interests are conducive to the maximizing of individuals’ disclosures and tight cooperation with the government on both cybersecurity and regulation.

Privacy legislation—on the sporadic occasions that it is enacted—already reflects this asymmetrical political economy through the “universal[]” inclusion of “law enforcement access to covered material, relying chiefly on more complex devices than a warrant and probable cause.” More generally, Congress’s modal solution to the challenges of political disagreement and technical deficiencies involves delegation under broad standards, which—perhaps uniquely in this domain—re-creates the perceived problems of open-ended discretion rather than re-

141 See Landau, 7 J Natl Sec L & Pol at 423–25 (cited in note 134) (describing congressional support for the industry position of weaker export controls on cryptography against the FBI’s campaign for stronger controls). After Snowden’s revelations, Apple and Google introduced default Secure Sockets Layer encryption to their mobile operating systems, and WhatsApp integrated TextSecure into the app. But these developments would impose no friction if those companies were to disclose information directly to the state. See Sean Gallagher, Web Giants Encrypt Their Services—but Leaks Remain (Ars Technica, June 10, 2014), archived at http://perma.cc/QH72-DC95; Lily Hay Newman, WhatsApp Is the First Major Messaging Service to Add Strong End-to-End Encryption (Slate, Nov 18, 2014), archived at http://perma.cc/LBZ9-YVV3.
solving them. No less than in the criminal law domain, in which legislators have spent most of the past decade bidding up penal sentences, Congress is unlikely to be a constant Fourth Amendment ally in new technological fields.

C. The Fragile Judicial Role

Over the past thirty years, the Supreme Court has evinced an increasing unwillingness to enforce the Fourth Amendment at the cost of forgoing criminal convictions. Instead, it has required rights holders to show not merely that an act was unlawful but also that it was especially egregious. I have argued elsewhere that this lack of concern flows not just from judges’ ideological preferences but also from a sense of the institutional interests of the Article III judiciary. This is a threshold reason to have tempered hope for the judiciary.

It would be surprising indeed if the judicial attitude became more latitudinarian when national-security concerns were in play. Experience with the Foreign Intelligence Surveillance Court (FISC) supports this inference. Since 2003, the FISC, which is tasked with approving foreign-intelligence wiretaps, has approved more than 97 percent of requests without modifi-

---

144 See Aziz Z. Huq, Judicial Independence and the Rationing of Constitutional Remedies, 65 Duke L J 1, 20 (2015) (“Since the mid-1970s, the Court has rationed the availability of [damages, suppression, and habeas relief] by installing a threshold requirement that individual rights claimants must typically demonstrate that an offending state official not only violated the Constitution, but did so in an especially flagrant and obvious way.”).

145 See id at 55 (“This historical evidence is complemented by a growing body of evidence that judges act upon the basis of institutional interests determined by their position within Article III.”).

146 In fact, courts’ approaches to remedies for constitutional violations do not change significantly between national-security and nonsecurity contexts. See Aziz Z. Huq, Against National Security Exceptionalism, 2009 S Ct Rev 225, 257.

147 I am skeptical that the concerns expressed in the Jones concurrences and in the Riley majority opinion about third-party collection will yield a meaningful friction on state collection efforts. I do not think the Court is well positioned to craft a rule of general application for (1) the many different kinds of governmental entities that collect and hold third-party data; and (2) the many different ways in which different kinds of third-party data can be used, especially given the endless ways in which different databases can be aggregated to de-anonymize and describe individuals. The Court lacks the political will to engage in a sustained campaign of regulation. In my view, it is likely to install a reasonableness rule rather than a warrant requirement.
cation. Of course, high grant rates alone might be explained by the presence of administrative systems that are capable of crafting lawful warrants, anticipating problems, and negotiating solutions. But the FISC has also promulgated relatively broad glosses on collection authority while weakening constraints on interagency dissemination and resisting proposals to introduce adversarial elements into the warrant process.

Further, even if the anticipatory effect of judicial oversight explains grant rates in the FISC, this may be due less to judicial action than to a sort of quasi-internal separation of powers, including a large, lawyer-staffed compliance apparatus in the DOJ and a pool of former government lawyers operating as “long-term lawyer assistants” to FISC judges. In effect, the government has developed an “iterative” process of processing and controlling that is more characteristic of bureaucratic rationality than of judicial oversight. To the extent that programs like the NSA’s bulk metadata collection have not generated abusive practices, this may be evidence that internal separation of powers of the sort that the Fourth Amendment’s drafters rejected in fact have some traction. On the other hand, it may also be that such internal controls are only as reliable as the political leadership of a given administration wishes them to be, such that they are effective only when they are the least needful.

* * *

There is a telling response offered to critics of the NSA’s bulk metadata collection that characterizes the program as no executive frolic but rather as an effort vetted by all three

149 See generally In re Application of the Federal Bureau of Investigation for an Order Requiring the Production of Tangible Things from [Redacted], 2014 WL 5463290 (FISC).
150 See Charlie Savage and Laura Poitras, How a Court Secretly Evolved, Extending U.S. Spies’ Reach (NY Times, Mar 11, 2014), archived at http://perma.cc/KBA9-QCYS (noting that the FISC order “significantly changed” prior procedures by allowing agencies “to share unfiltered personal information”)
153 Id at 164.
Regardless of what one thinks of bulk collection, the response is suggestive of a wider institutional condition. To the extent that the Framers anticipated that either Congress or the federal judiciary would be vigilant guardians of Fourth Amendment values, their expectations about institutional incentives have not been met. Neither of the Fourth Amendment’s intended institutional mechanisms works as intended, largely due to institutional officeholders’ weak incentives regarding rights-related ends. This erosion in the institutional predicates of Fourth Amendment enforcement is certainly not the sole reason for the observed fragility of constitutional privacy today, but it is likely one explanation for its current limited reach.

III. THE FOURTH AMENDMENT REDITIVUS?

Given the erosion of the Fourth Amendment’s institutional infrastructure, debates about whether Congress or courts are better at vindicating privacy might be better abandoned in favor of alternative, more-profitable inquiries. The institutional-allocation question, pursued lately by Professors Orin Kerr[155] and Erin Murphy,[156] has yielded no obvious clear answers—only stalemate. Rather, a new Fourth Amendment jurisprudence (if such a thing were even feasible) would, in my view, begin by drawing new distinctions and attending to alternatives to hallowed institutional pathways. In what follows, I sketch a possible doctrinal approach—albeit in skeletal and suggestive form—paying particular attention to problems related to electronic communications and large aggregates of third-party data. At bottom, however, I am skeptical that these reforms will see the light of day. Ultimately, it is more likely that privacy allocations will reflect underlying distributions in socioeconomic (and hence political) power.

Consider first some possible reforms. Here, it is useful to start from the observation that the acquisition and use of infor-
mation by the federal government looks starkly different from states’ and localities’ parallel activities. States and localities are (all else being equal) more focused on ordinary crime control. Predictive algorithmic instruments are already deployed by urban police to identify crime hot spots and to make deployment decisions within regularized and bureaucratic “strategic control systems” (or CompStat).\textsuperscript{157} Given the efficacy of CompStat and hot spot\textsuperscript{RT: MW} policing,\textsuperscript{158} expansions of local police departments’ authority to exploit pools of electronic data (for example, telecommunications data and social media) might decrease the need for more intrusive and violent measures such as stings, undercover officers, and informants. If such gains come tethered to other costs,\textsuperscript{159} both the magnitude and the distribution of such costs as well as associated benefits at this local level will be distinct and different from the costs that are associated with the federal government’s exploitation of similar data. To analyze both local and national actors through the same lens—as the Court is wont to do\textsuperscript{160}—therefore seems to me to be unwise and distorting. The Fourth Amendment, in short, would benefit from a healthy dose of federalism.

Regarding the federal government, I reject as implausible the aspiration that aggregate data collection and analysis be terminated. So long as private companies engage in such activities (and can profitably vend their output to the state) and foreign-state competitors race to secure both defensive and offensive tools,\textsuperscript{161} the federal government will not stop its data aggregation and analysis business. Moreover, that business will evolve in accord with the dictates of strategic, geopolitical forces—not endogenous legal concerns. To the extent that Fourth Amendment law trains exclusively on the act of acquiring information or penetrating a private space, it is merely gestural.

Instead, it is worth considering whether the harms identified with data-driven surveillance necessarily arise from “puta-
How the Fourth Amendment

tive violations of privacy” or rather from “an additional concern about the possibility of abuse of the information obtained.” Leading clarion calls against electronic surveillance prominently adumbrate the former concern, not the latter. Intuitively, this resonates: When a person is seized by police in the course of a street or vehicular encounter, triggering the Fourth Amendment, dignitary and emotional harms can accrue immediately, even absent violence. But there is no parallel to such contact harms in the use of electronic data. This may counsel for more-expansive and more-careful minimization and use procedures, matters that are now allocated to the reticulated backwaters of FISA warrant design. Whether such dissemination and use restrictions are ranked as a Fourth Amendment rule or are merely good practice seems to me to be distinctly less important than the considerable difficulties of implementation.

For the political economy analysis of Part II suggests that reforms of this kind are unlikely to emerge from our current democratic or judicial arrangements. Instead, those still fervently concerned about privacy per se will likely be forced to seek solutions outside the state. Like the residents of Baltimore’s Mondawmin neighborhood, citizens can resort to self-help to restore the balance of power between themselves and the state. At least in the communications domain, this means deploying universal encryption and anonymizing technologies such as Secure Sockets Layer (SSL), a protocol for securing bidirectional data tunnels; Pretty Good Privacy (PGP), a program for encrypting and signing messages; Domain Name System Security Extensions (DNSSEC), a set of specifications for authenticating domain names); Tor, a program for anonymity; and full-disk encryption (FDE), an approach to protecting hardware. Although SSL and PGP are free (and based on robust open-source code), in practice operationalizing universal encryption is “difficult and

162 Marmor, 43 Phil & Pub Aff at 15–16 (cited in note 56).
163 See, for example, Neil M. Richards, The Dangers of Surveillance, 126 Harv L Rev 1934, 1935 (2013) (describing surveillance as harmful because it “chill[s] the exercise of our civil liberties” and alters “the power dynamic between the watcher and the watched”[SP].
164 See 50 USC § 1861(g)(1) (requiring the attorney general to “adopt specific minimization procedures” for the acquisition of “tangible things”). See also Kris, 7 J Natl Sec L & Pol at 237–41 (cited in note 154).
166 See Nicholas Weaver, Our Government Has Weaponized the Internet. Here’s How They Did It (Wired, Nov 13, 2013), archived at http://perma.cc/GF6V-SAFZ.
expensive.”167 Self-help in the electronic-communication-privacy domain thus selects for those with adequate technical skills or resources to purchase access to those skills. Similarly, privacy against algorithmic exploitation of bulk noncontent data (for example, telecommunications metadata and financial records) is best secured by bespoke, and hence expensive, arrangements in which secrecy from both the provider and the government is assured.168 Privacy, in short, is on the road to becoming “a [p]remium [s]ervice,”169 acquired only by those with technical knowledge or economic resources.170

This suggests that the last redoubt of privacy, self-help against state exploitation of electronic data, will likely have sharp regressive effects. Whether this is desirable depends on your views of distributive justice. If privacy in the electronic data domain does trend in this direction, however, it will at least yield a sort of consistency. For, as Professor Stuntz acutely observed more than a decade and a half ago, the distribution of privacy in our domesticated Fourth Amendment already “makes wealthier suspects better off than they otherwise would be, and may make poorer suspects worse off.”171

It is for this reason that I conclude that the Internet, big data, and new forms of communicative technology are unlikely to generate new liberties. They likely will instead reproduce and entrench extant hierarchies. And as Fourth Amendment jurisprudence shifts from the streets to the cloud, it too will again reflect with some fidelity our divided, unequal, and irremediably unjust social order.172 Whether our constitutional law can do otherwise is a question that remains to be answered.
