The Decline of Supreme Court Deference to the President
Lee Epstein & Eric A. Posner*
March 6, 2017

Abstract. According to entrenched conventional wisdom, the president enjoys considerable advantages over other litigants in the Supreme Court. Because of the central role of the presidency in the U.S. government, and the expertise and experience of the Solicitor General’s office, the president usually wins. However, a new analysis of the data reveals that the conventional wisdom is out of date. The historical dominance of the president in the Supreme Court reached its apex in the Reagan administration, which won nearly 80% of the cases, and has declined steadily since then. In the Obama administration, the presidency suffered its worst win rate, barely 50%. After documenting this trend, we discuss possible explanations. We find evidence that the trend may be due to growing self-assertion of the Court and the development of a specialized private Supreme Court bar. We find no evidence for two other possible explanations—that the trend is due to greater executive overreaching than in the past, or ideological disagreements between the Court and the presidency.

Scholars of presidential power agree that the presidency is an extraordinarily powerful institution, and that it is a far more powerful institution today than it was in the past. During most of the nineteenth century, the presidency was largely an administrative institution that took orders from Congress.1 Aside from the earliest presidents, who helped set precedents for presidential power, only Andrew Jackson and Abraham Lincoln, in both cases acting in unusual conditions, exercised significant power. All of this changed in the twentieth century. Theodore Roosevelt, Woodrow Wilson, and Franklin Roosevelt turned the presidency into an administrative and foreign-policy powerhouse, while Congress and the judiciary were shoved to the side.2 After World War II, the “imperial presidency”3 was consolidated. The modern imperial president determines domestic policy using powers delegated by Congress, and implements it using the vast federal bureaucracy. A standing army and foreign-service bureaucracy enable the president to dominate foreign relations.4

Law professors have traced the growth of presidential power in legal doctrines that have been put into place by the courts. The Supreme Court initially resisted the creation of an administrative state controlled by the president. It struck down broad delegations of policy-making and judicial power from Congress to the executive branch in the 1930s. But it reversed itself after Roosevelt threatened to pack the Court. In recent decades, the Court further expanded the president’s power by, among other things, requiring courts to defer to regulators’ reasonable interpretations of the law (the Chevron doctrine), and to their evaluations of the facts.

The Court has also either approved of, or declined to block, the president’s expansion of power to conduct foreign relations. A range of doctrines require courts to defer to the president’s interpretation of treaties, to block private litigants from challenging national-security policies, and to stay out of “political” disputes between Congress and the president, which presidents typically win. In the view of some scholars, the only legal check on the president’s power to conduct foreign relations is Congress’ power to withhold funds, which is often impractical.

Political scientists also agree that the president’s power—in domestic and foreign relations alike—is vast. Terry Moe and William Howell, for example, emphasize the ways in which constitutional norms and ordinary politics give the president advantages in conflicts with the other branches of government. The president, as the focus of public attention, can rally the public to his side. As the leader of the bureaucracy, the president has the “power of unilateral action.” He can implement a policy, then force Congress to respond. For example, despite the formal legal constraints embodied in the War Powers Act, the president can commit military forces abroad and then dare Congress to defund them, which it rarely does. Congress and the courts are slow-moving, decentralized institutions, which labor under the public eye. The president commands a hierarchy, which enables him to move swiftly, secretly, and decisively. A skillful president can use these advantages to circumvent legal constraints imposed by the other branches.

The president’s extraordinary power gives it significant advantages over private litigants. The executive branch litigates in the Court far more frequently than any other person or entity. It therefore uniquely benefits from an expert, experienced Supreme Court litigator—the Solicitor General’s (SG) office. And, independent of the power of the president’s legal arguments, the Court

---

7 See, e.g., United States v. Curtiss-Wright Export Corp., 299 U.S. 304, 320 (1936) (holding that the president’s power over foreign affairs is “plenary and exclusive”).
may be reluctant to rule against the president. The president is a uniquely powerful figure as an
embodiment of the will of the people in a democracy. He may refuse to comply with the Court’s
judgments if he disagrees with them. And the president, working with Congress, has the legal
means to retaliate against the Court if it does not do his bidding—by restricting its jurisdiction and
limiting the funding of the judiciary.

If the presidency is enormously powerful—if it benefits from numerous legal doctrines that
require deference, and can maneuver around others because of its political advantages—then one
would expect the president to prevail in the Court with great frequency.14 This view is consistent
with a literature produced by empirically oriented political scientists, who have examined the
success rates of the president in the Supreme Court, and found that they have been consistently
high.15 During his years in office, Franklin Roosevelt won almost two-thirds of his 850 cases;
Ronald Reagan did even better, prevailing nearly 80% of the time.16 Some commentators worry
about the president’s success, while others applaud it,17 but neither side questions the dominating
force that is the executive branch.

However, we have discovered that the president’s success rate in the Supreme Court peaked
during the Reagan administration, and has declined steadily since then. George H.W. Bush’s win
rate was 70.2%; Bill Clinton’s was 62.9%; George W. Bush’s was 59.8%; and Obama’s was
50.5%.18 This until-now unknown trend raises significant questions, and may force us to rethink
the deeply entrenched academic assumption about the rise of presidential power. Is it possible that
presidential power reached its apex in the Reagan administration, and has diminished since then?
Or is something else going on?

Law professors may have been overly influenced by formal doctrine. There is some evidence
that the Chevron doctrine has been applied opportunistically—when a majority of the Court agrees
with the president and not when it disagrees with him.19 There is also, as a matter of formal
document, some indications that the Supreme Court and the lower courts have in recent years begun

---

14 As we discuss below, selection effects can mute this impact. If a doctrine greatly favors the president, then private
litigants may adjust their behavior rather than challenge him and lose. However, selection effects will not eliminate
the effect of doctrine in normal conditions. For a lucid explanation, see Daniel Klerman & Yoon-Ho Alex Lee,
Inferences from Litigated Cases, 43 J. Legal Stud. 209, 212 (2014).

15 See, e.g., Salokar, supra note 13, at 22-31.

16 See infra Part III.

17 These contrary positions seem related to views of the Court’s role in a democracy. To some commentators, the
Court should defer to the wishes of the people as expressed by their elected representatives. See Jeremy Waldron,
Law and Disagreement (1999). To others, it should be aggressive, monitoring Congress and the president to ensure
that they do not intrude into individual or state rights. See Ronald Dworkin, Law’s Empire (1988). The former view
would favor a high presidential win rate, the latter would not—putting aside selection effects.

18 See infra Part III.

19 See Linda R. Cohen & Matthew L. Spitzer, Judicial Deference to Agency Action: A Rational Choice Theory and An
Empirical Test, 69 S. Cal. L. Rev. 431 (1996); but see Matthew C. Stephenson, Mixed Signals: Reconsidering the
evidence for the Cohen & Spitzer thesis using later data). Nonetheless, there is substantial evidence that Chevron is
invoked opportunistically in some cases, and that judicial ideology plays a role. See William N. Eskridge & Lauren E.
Baer, The Continuum of Deference: Supreme Court Treatments of Agency Statutory Interpretation, 96 Geo. L.J.
1083, 1091 (2008); Thomas J. Miles & Cass R. Sunstein, Do Judges Make Regulatory Policy? An Empirical
to cut back on deference to the president, in both foreign relations and domestic administration. It is also possible that scholars of all types have focused on salient events while disregarding the more humdrum business of governing. Clinton, for example, went to war in Serbia in defiance of Congress, but also failed to implement key elements of his domestic agenda, like health care reform, and instead adopted the Republican Congress’ conservative agenda as his own. This allowed him to declare political victory while actually implementing policies—like welfare reform—that he did not champion, at least initially. George W. Bush used executive power aggressively against Al Qaeda, but also, to an extent that has often been downplayed by scholars, relied for authority on an enormous amount of new legislation enacted by Congress while succumbing to congressional pressure over coercive interrogation and other policies where there was disagreement. Obama’s most important accomplishments were legislative—the stimulus bill, the Dodd-Frank Act, and the Affordable Care Act—and took place when Democrats controlled both houses of Congress. Through the rest of his presidency, he fought a rearguard action to protect these accomplishments, and used regulatory powers to make incremental changes that Congress refused to legislate, in areas of climate regulation and immigration.

Of course, one could make the opposite argument by focusing on the successes and downplaying the failures. Maybe we should count Obama as powerful because he was able to issue climate regulations, enter the Paris climate treaty, and refuse to deport many thousands of unauthorized immigrants in defiance of Congress. Scholars often disagree about whether the president is very powerful or very weak. The real problem is methodological: how exactly do we measure presidential power?

In this Essay, we measure presidential power by looking at the president’s win rate in the Supreme Court. This measure is obviously only partial, and is subject to a number of limitations that we discuss below. But it has a major advantage, which is that it is easily determined and compared across presidents. After presenting some more historical background in Part I, in Part II we explain our data and present our main findings. In Part III, we turn to possible explanations for our results.

We examine four such explanations. The first is that the Supreme Court has become a more powerful and self-confident institution in recent decades. Many commentators have argued that the Court has become more “activist” over the years, in the sense of more willing to strike down statutes. If so, it is possible that an activist Court would also rule against the president more frequently. We find some evidence consistent with this theory.

Next, we investigate the possibility—widely discussed in the press and the academic literature—that presidents have become more aggressive. If so, then it is possible that even without

---

21 See, e.g., Michigan v. EPA, 135 S. Ct. 2699 (2015) (striking down an EPA regulation because the EPA did not adequately consider costs). Skepticism about judicial deference to administrative determinations by the executive has been growing in the conservative legal community. See, e.g., Philip Hamburger, Is Administrative Law Unlawful? (2014). At least one justice—Thomas—and one likely future justice—Gorsuch—appear to agree with it.

23 For a discussion, see Pildes, supra note 1.

changing its traditional pro-president doctrine, the Court may have ruled against the president with
greater frequency because the president’s actions have violated legal norms with greater frequency.
However, we do not find evidence for this theory.

Third, we examine the possibility that recent presidents have done poorly in the Court because they happen to have faced Supreme Court justices who are ideologically predisposed against them. However, we can eliminate this explanation as inconsistent with the data.

Finally, we consider the possibility that presidents have done poorly because of the growth of a specialized Supreme Court bar, which has eliminated the advantage that the specialized SG’s office had previously enjoyed.\textsuperscript{25} We find evidence for this explanation.

I. Presidents in the Supreme Court

History is full of reports of presidents complaining about the Supreme Court. The country’s third president, Thomas Jefferson, attacked Chief Justice Marshall’s iconic decision in \textit{Marbury v. Madison},\textsuperscript{26} even though Marshall ruled in Jefferson’s favor:

The court determined at once, that being an original process, they had no cognizance of it; and therefore the question before them was ended. But the Chief Justice went on to lay down what the law would be, had they jurisdiction of the case, to wit: that they should command the delivery… Yet this case of Marbury and Madison is continually cited by bench and bar, as if it was settled law, without any animadversion on its being merely an \textit{obiter} dissertation of the Chief Justice.\textsuperscript{27}

Responding to yet another opinion delivered by the Chief Justice, \textit{Worcester v. Georgia},\textsuperscript{28} President Andrew Jackson reportedly declared: “Well: John Marshall has made his decision: now let him enforce it.”\textsuperscript{29} In Lincoln’s first inaugural address he took aim at the infamous \textit{Scott v. Sandford}\textsuperscript{30}—as “an agitated Chief Justice Roger Taney looked on, trembling with rage.”\textsuperscript{31}

\textsuperscript{25} See Richard J. Lazarus, Advocacy Matters Before and Within the Supreme Court: Transforming the Court by Transforming the Bar, 96 Geo. L.J. 1487 (2008).
\textsuperscript{26} 5 U.S. 137 (1803).
\textsuperscript{28} 31 U.S. 515 (1832).
\textsuperscript{30} 60 U.S. 393 (1857). Lincoln said:

I do not forget the position assumed by some that constitutional questions are to be decided by the Supreme Court, nor do I deny that such decisions must be binding in any case upon the parties to a suit as to the object of that suit, while they are also entitled to very high respect and consideration in all parallel cases by all other departments of the Government…. At the same time, the candid citizen must confess that if the policy of the Government upon vital questions affecting the whole people is to be irrevocably fixed by decisions of the Supreme Court, the instant they are made in ordinary litigation between parties in personal actions the people will have ceased to be their own rulers, having to that extent practically resigned their Government into the hands of that eminent tribunal.
Battles of the 20th century are equally well known. Teddy Roosevelt was not shy about asking Congress to overturn decisions of the Court or even criticizing the justices. Of Oliver Wendell Holmes, his appointee and formerly good friend, Roosevelt said: “I could carve out of a banana a judge with more backbone.” Roosevelt’s cousin, Franklin, famously went much further by proposing a plan to enlarge the Court (with, naturally, justices of his own choosing) in response to decisions invalidating his New Deal programs. Though Barack Obama proposed nothing so dramatic, he was hardly shy about calling out the justices—again, in their presence—for their decision in *Citizens United.*

These are just some of the many anecdotes illustrating the sometimes-rocky relationship between the Court and the president; we could add many more: Truman’s contention that the Court could not take away his power to seize the steel mills; Lincoln’s refusal to comply with a decision forbidding him alone to suspend the writ of habeas corpus; and Clinton’s claim that the Court’s invalidation of the line-item veto amounted to “a defeat for all Americans.”

And yet, scholars tell us that these and other instances of Court-bashing are the exceptions; that in fact presidents do quite well in the Court. According to Scigliano, “throughout its history the [executive branch] has won most of its cases in the Supreme Court, and at a level that has not varied

---

32 See, e.g., Theodore Roosevelt, Sixth Annual address to Congress, December 3, 1906, http://www.presidency.ucsb.edu/ws/?pid=29547 (“The first purely income-tax law was past by the Congress in 1861, but the most important law dealing with the subject was that of 1894. This the court held to be unconstitutional… The decision of the court was only reached by one majority. It is the law of the land… Nevertheless, the hesitation evidently felt by the court as a whole in coming to a conclusion, when considered together with the previous decisions on the subject, may perhaps indicate the possibility of devising a constitutional income-tax law which shall substantially accomplish the results aimed at.”).

35 Barack Obama, State of the Union Address, January 27, 2010, http://millercenter.org/president/obama/speeches/speech-5706. (“With all due deference to separation of powers, last week, the Supreme Court reversed a century of law that I believe will open the floodgates for special interests, including foreign corporations, to spend without limit in our elections. I don't think American elections should be bankrolled by America's most powerful interests, or worse, by foreign entities. They should be decided by the American people. And I'd urge Democrats and Republicans to pass a bill that helps correct some of these problems.”).

37 In re Merryman, 17 Fed. Cas. 144 (C.C.D. Md. 1861) (No. 9,487). Lincoln said, “It was decided that we have a case of rebellion and that the public safety does require the qualified suspension of the privilege of the writ which was authorized to be made. Now it is insisted [in Merryman] that Congress, and not the Executive, is vested with this power; but the Constitution itself is silent as to which or who is to exercise the power; and as the provision was plainly made for a dangerous emergency, it can not be believed the framers of the instrument intended that in every case the danger should run its course until Congress could be called together, the very assembling of which might be prevented, as was intended in this case, by the rebellion.” Abraham Lincoln, Special Session Message, July 4, 1861, http://www.presidency.ucsb.edu/ws/?pid=69802.

from one period to another.”39 From an analysis of the Eisenhower through Reagan administrations, Sakolar reports, the “United States enjoys unrivaled success.”40 Black and Owens assert that the president’s modern-day representative in the Supreme Court—the Office of the Solicitor General—not only “wins an astonishingly high percentage of its Supreme Court cases”41 but also influences the Court. 42

The president’s success before the Court is reflected not only in his win rate. It is also reflected in doctrinal formulations that the Court has adopted over the years. These doctrines, often called “deference doctrines,” require courts to treat the president more favorably than typical private parties who appear before the court. The most famous of these is the Chevron doctrine, which requires courts to defer to the executive’s interpretation of a statute that is “reasonable.”43 In practice, this means that when an ambiguous statute is open to a range of interpretations, the executive branch is permitted to choose the interpretation that is legally binding. By contrast, in a dispute between private parties, the court determines the correct interpretation of an ambiguous statute. Other doctrines require courts to defer, within limits, to other executive determinations, such as fact-finding by regulators when they issue rules, fact-finding in administrative hearings, and the refusal to prosecute criminals or enforce regulations.44

Another group of doctrines obliges courts to defer to the president in cases touching on national security and foreign affairs. These rules require deference to treaty interpretations, the president’s judgment as to whether foreign countries pose threats and other fact-finding, and the decision to recognize a foreign state, among others.45

What has accounted for the president’s dominance before the Court? One can imagine many possible theories. For clarity, we group them into categories based on the incentives of the relevant parties—the justices, the president, and private litigants.46

The justices. The justices might be biased in favor of the president (or, more generally, the executive branch), and against private litigants. One reason for a pro-presidential bias is that justices may fear retaliation from the president if they consistently rule against him. Despite their life-tenure status, the justices have good reason to be sensitive about the president’s attitude toward him. The president can propose or support legislation that limits their power—like Franklin Roosevelt’s court-packing plan, or the jurisdiction-stripping provisions enacted during Reconstruction. The president’s support is also needed for routine legislation that funds the courts
and raises salaries. Justices might also fear the delegitimizing effects of public criticism of the court by the president—and in the extreme, refusal to comply with an order (the Andrew Jackson example).

Judicial bias in favor of the president can also be given a more positive explanation. Justices might, as a general matter, trust the executive branch more than private litigants. They might believe that the executive branch deserves some degree of trust or respect simply because it is a coequal branch of government, or because (unlike private litigants) the executive branch presumably tries to act in the public interest rather than in someone’s private interest. Justices might also trust the executive branch because it appears repeatedly before the court, and therefore has strong incentives to be honest.

Justices are all nominated by the president, and presidents therefore play a role in determining who they are. While the lion’s share of attention has been given to presidents’ incentives to nominate persons who are ideologically compatible (for or against Roe v. Wade, for example), presidents might also favor justices who are generally sympathetic to the executive branch.47 Indeed, while Democratic and Republican presidents choose ideologically dissimilar justices,48 they are likely to agree on pro-executive justices because both types of presidents want justices to rule in favor of the executive branch. Some evidence supports this hypothesis. Many justices have served as prosecutors and other types of lawyers in the executive branch; hardly any justices have been public defenders.49

The president. The justices may rule in favor of the president not because the justices are biased in favor of the president, but because the president brings stronger cases to the Court than private litigants do. As noted above, the president may feel that he can obtain the benefit of the doubt from the Court on hard and important cases as long as his lawyers consistently make good arguments to the Court and (accordingly) never bring weak cases. The president—and other relevant officers of the executive branch—might also pay a political price if they lose in the Court, and so refrain from bringing cases they are likely to lose.

The president also benefits from representation by the SG’s office, which specializes in Supreme Court litigation. Because of the enormous size and importance of the executive branch, it appears before the Court far more than any other entity or person. The prestige of the office attracts experienced and talented lawyers, including graduates from the best law schools.50

As Lazarus points out, it is not only sheer talent that explains the success of attorneys in the SG’s office. It is also their deep knowledge and familiarity with the Court.

Because they immerse themselves in the work of the Court, the attorneys of the Solicitor General’s Office, unlike many of their opposing counsel, become completely familiar with the Justices and their precedent, including their latest concerns and the inevitable cross-currents between otherwise seemingly unrelated cases that would be largely invisible to those who focus

47 For a discussion, see Lee Epstein & Eric A. Posner, Supreme Court Justices’ Loyalty to the President, 45 J. Legal Stud. 401 (2016).
48 See Jeffrey A. Segal & Harold J. Spaeth, The Supreme Court and the Attitudinal Model Revisited (2002)
49 See Rob Robinson, Executive Branch Socialization and Deference on the U.S. Supreme Court, 46 Law & Soc’y Rev. 889 (2012).
50 See Salokar, supra note 13, at 33; Black & Owens, supra note 13.
on just one case at a time. They are also comfortable at the lectern, for the simple reason that they have been there often before at least as co-counsel, if not lead counsel, presenting argument. They work hard as repeat litigants to establish their credibility with the Justices. They know how to write briefs for that audience, how to utilize precedent, and how to anticipate problems and exploit opportunities.51

If the SG’s office has better information about the likely outcome in the Supreme Court than the private litigant does, then the SG can drop weak cases, or make narrower arguments as necessary, to enhance its win rate.52

This theory suggests another implication of significance. If the SG’s office seeks to maintain credibility with the Court so that the Court continues to trust it, then the SG has a strong incentive to settle weak cases and pursue only strong cases. Consider, for example, a dispute between the IRS and a taxpayer that turns on an arcane point of tax law. Because the SG cares about the Supreme Court’s opinion of it, the SG might seek certiorari after losing in a court of appeals only if it believes that the law is on its side. The private litigant will continue litigating even if the SG is correct as long as the private litigant thinks that the magnitude of the possible award is large enough to justify a below-50% probability of winning.

Moreover, if the private litigant loses in the court of appeals, it will seek certiorari if the probability of winning multiplied by damages exceeds litigation costs. As long as those damages are high, and litigation costs are relatively low (on which, see below), the private litigant will seek certiorari even for a relatively weak case. The private litigant, unlike the SG, does not incur any additional reputational cost from losing a weak case before the Court because the private litigant is not a repeat player before the Court.53

There is yet another related reason why the executive branch may have a high win rate. Because of its vast size, the executive branch is frequently a party to numerous redundant or partially redundant cases that involve the same issue. In the recent controversy over the Trump travel ban order, for example, different private litigants pursued dozens of cases in different courts against the president.54 Subject to certain limitations and procedural constraints, the Justice Department (usually acting on the advice of the SG) enjoys discretion as to which adverse judgment to appeal. It can therefore choose the weakest opinion or the opinion based on the least sympathetic facts. By contrast, private litigants are very rarely in this position. This is another reason why the president’s win rate should be high, and indeed explains why the president’s win rate is higher when he is a petitioner (and so is choosing to bring a case to the Court) than when he is a respondent, and is forced to defend whatever case a private litigant happens to persuade the Supreme Court to hear.55

51 Lazarus, supra note 25, at 1497.
52 See Klerman & Lee, supra note 14, at 214, 223. For an alternative theory of how the Solicitor General influences the Court—by signaling the president’s ideological views—see Bailey et al., supra note 42.
53 See Daniel Klerman & Yoon-Ho Alex Lee, The Priest-Klein hypotheses: Proofs and Generality, 48 Inter’l Rev. L. & Econ. 59, 65, 69 (2016) (party with more at stake has higher win rate).
55 Epstein & Posner, supra note 47, at 411. This is true for all presidents except Franklin Roosevelt, with the average of 74.98% win rate when petitioner, and 54.88% when respondent. Id.
The private litigants. If either the justices are biased in favor of the executive branch, or the executive branch benefits from superior lawyers, the question arises why the litigants on the other side don’t settle more often. After all, litigation is expensive and a loss in the Supreme Court might be embarrassing. If private litigants settled their weaker cases, then they would not do as badly in the Supreme Court as the historical data indicates.

However, there are several reasons for thinking that private litigants will seek review in the Supreme Court, or defend themselves before the Court, even when their probability of victory is slim. First, as noted above, the expected benefit, even if the probability of prevailing is low, may well exceed the cost of litigation. The cost of litigating at the Supreme Court level is not high. There is no fact-finding and most of the legal arguments are developed at lower levels. For many private litigants, the benefit—in terms of damages or another remedy—if they prevail in the Supreme Court may be considerable. Meanwhile, the executive branch may be unwilling to settle such cases because of the political difficulty of paying a large settlement in a weak case, or a bureaucratic unwillingness to settle cases because of possible adverse precedential effects, or, as just noted, a desire to enhance its reputation with the Court by winning another case.

Second, many litigants seek symbolic victories rather than money damages. Public interest groups, like the Sierra Club, and business groups, like Business Roundtable, please their donors by bringing difficult-to-win-cases for the sake of vindicating an important principle. They also might benefit from the news value of appearing before the Supreme Court, which would enhance their reputation with the public.

Compare ordinary litigation between private parties—for example, a creditor sues a debtor for $100,000, where legal costs are likely to be much higher than that. The creditor and debtor have a strong incentive to settle in order to avoid legal costs. That means that only the most difficult cases will be resolved by a court, suggesting that the win rate for the plaintiff should be about 50%. By contrast, in cases between private parties and the executive that reach the Supreme Court, legal costs are likely to matter very little. As explained above, they are not high for private parties, and the executive branch does not fully internalize legal costs, which are borne by taxpayers, and so will have weak incentives to settle as well. If the executive branch acts in a bureaucratic manner—it always defends itself, and litigates any plausible case as a plaintiff—while the private litigant will litigate weaker cases because of the high monetary or symbolic stakes, then a pro-president win rate is predictable.

There are other possible explanations for high presidential win rates but they are less robust than the explanations that we have described so far. For example, imagine a setting in which the court of appeals judges are mostly Republicans, the Supreme Court justices are mostly Democrats, and the president is a Democrat. (This pattern could occur in reverse, as well, of course.) It is possible that the executive branch loses many cases in the courts of appeal, but then enjoys a high win rate in the Supreme Court, since the Supreme Court justices are more closely aligned with the president’s ideology than the lower courts’ judges are. But this theory—and others like it—cannot

---

account for the consistent pattern of high executive branch win rates over history because the theory assumes a state of affairs that occurs only episodically.57

II. The Conventional Story Meets Data

To assess the conventional story of presidential success in the Court, we created an original dataset consisting of cases of concern to each of the modern-day presidents (from Franklin D. Roosevelt forward).58 The modern U.S. Supreme Court Database served as our foundation.59 This version covers all orally argued cases (including per curiam opinions) decided between the 1946 and 2015 terms. To include the Franklin Roosevelt administration, we appended cases from 1932-1945 terms using the legacy Supreme Court Database.60 In total, our dataset covers 13 presidents and 84 Court terms. For all terms, we exclude per curiam decisions.61

To define a case of concern to the president, we used the petitioner and respondent variables in the U.S. Supreme Court Database. These variables allowed us to identify cases in which the United States, an executive actor (e.g., the Attorney General or the president himself), or a federal agency was a party.62

This procedure, though systematic and reliable, has its limits. Because the Database identifies only the lead parties, cases in which the United States or an executive actor was a party but not the lead party were improperly excluded.63 Moreover, in some cases one government agency was pitted against another, making it difficult to classify the president as the winner or loser. To address these problems, we took the additional step of determining whether the SG or the Office of the

---

57 Yet another possibility is that courts of appeals tend to be more opposed to the power of the executive branch than the Supreme Court is. Perhaps, the Supreme Court is more conscious of the risks of interbranch conflict if the executive branch loses too frequently in Court. We cannot test this theory because we lack presidential win rates in the courts of appeals over the relevant time period and for all the relevant cases. Prior work indicates that presidential win rates for agency decisions—involving different agencies and different time periods—range from 58% to 64%. See Martha Anne Humphries & Donald R. Songer, Law and Politics in Judicial Oversight of Federal Administrative Agencies, 61 J. Pol. 207, 215 (1999) (58%); David H. Willison, Judicial Review of Administrative Decisions: Agency Cases before the Court of Appeals for the District of Columbia, 1981-1984, 14 Amer. Pol. Q. 317, 321 (1986) (66%); Thomas J. Miles & Cass R. Sunstein, Do Judges Make Regulatory Policy?, 73 U. Chi. L. Rev. 823, 852 (2006) (61.7% for EPA and 70.1% for NLRB); Thomas J. Miles & Cass R. Sunstein, The Real World of Arbitrariness Review, 75 U. Chi. L. Rev. 761, 767 (2008) (64%). These numbers are roughly comparable to the presidential win rate in the Supreme Court, so if they are generalizable, they do not suggest a higher level of skepticism about executive power in the courts of appeals than in the Supreme Court.

58 See also Epstein & Posner, supra note 47.

59 Available at http:/supremecourtdatabase.org.

60 Of the 83 president cases decided during the 1932 term, Hoover was in office for 46 (55.4%) and FDR for 37 (44.6%). We include only FDR’s 37 cases.

61 That is, we include decisionType= 1 (signed majority opinion) or 7 (judgment of the Court).

62 We also checked the issue value 130015 (executive authority vis-a-vis congress or the states) and lawSupp values involving provisions of Article II.

63 We should note that the current version of the legacy Database covers only the first docket in decisions in which the Court consolidated petitions under one U.S. Reports citation. When we searched to determine whether the government was an additional party, we followed the Database—including only those cases in which the government was a party in the first docket.
Attorney General (AG) represented the petitioner or the respondent. We hand-collected the data for the 1932-1945 and 2002-2015 terms, we used Collins’ data for the 1946-2001 terms. This step allowed us to identify cases in which the United States or executive actors/agencies were not the lead parties. We were also able to deal with cases in which the federal government was on both sides. If the AG or the SG represented the United States, a federal agency, or various executive actors, our rule was to code based on the AG’s or SG’s position (to reverse or affirm). If the AG/SG did not represent the agency (for example, the Interstate Commerce Commission in the 1940s) or the president (in say, Clinton v. Jones), or the United States or the AG/SG did not enter the case as an amicus curiae, then we coded the president’s position as the same as the executive actor. If the AG/SG filed an amicus brief opposed to the agency’s position, we coded the president’s position based on the AG’s/SG’s recommendation, not the agency’s. In other words, the AG/SG was our tiebreaker.

Following these rules, we created variables indicating whether the “president” (a combination of US/agency/executive actor) was the petitioner or respondent. We refer to these cases as “president cases.” (We identified the specific president in office based on the date of the Court’s decision.)

Overall, there are 3,794 of these cases (32,582 votes) in our dataset—or about 40% of all orally argued cases during the 1932-2015 terms. These figures are not surprising; scholars have long noticed the outsized role of the government in Supreme Court litigation. Even so, there appears to be some downward trend in the data, as Figure 1 shows. Setting aside variation within administrations (note the minimum and maximum range lines in the figure), the President’s participation as a party in Supreme Court litigation has declined from 52% during the FDR, Truman, and Eisenhower administrations to 36% from Kennedy through Obama. President-by-president, term-by-term, and case-by-case regressions all confirm a statistically significant decline. For example, the predicted probability of the president being a party in a case in the 1952 term is nearly 0.50. Fifty years later, in 2002, the probability drops to 0.32.

---

64 We conducted Lexis searches on “attorney general” or “solicitor general.” We went through each case because the searches turned up many false positives.
65 Available at http://blogs.umass.edu/pmcollins/data/.
67 For 16 of these cases, the Supreme Court Database codes the winning party as “unclear.” We do not include these cases in our analysis of the president’s success, decreasing the total to 3,794.
68 The exact figure is 41.9% (3794/9061).
69 See works cited in supra note 13.
70 See also supra note 60.
71 The difference is statistically significant at the 0.01 level.
72 0.47, with a 95% confidence interval of [0.44, 0.50]. Based on a logistic regression of whether the president was a party in the case on term (with standard errors clustered on term or the sitting president).
73 The 95% confidence interval is [0.30, 0.35].
**Figure 1.** Fraction of Cases with Presidential Involvement, Ordered Chronologically

![Diagram showing fraction of cases with presidential involvement for various presidents]

**Notes:**

1. The number in parentheses is the total number of cases the Court decided when the president was in office, whether he participated or not.
2. The bars show the (weighted) mean level of participation for each president. The capped lines show the minimum and maximum participation fractions for each term that the president was in office. Minimums and maximums exclude terms in which the sitting president participated in fewer than 10 cases. For example, we exclude Kennedy’s one case in the 1963 term when we calculated the minimum and maximum fractions, though the one case is included in Kennedy’s mean. For purposes of calculating minimum and maximum fractions, the number of Supreme Court terms included is 13 for Roosevelt; 9 for Eisenhower; 8 for Truman, Reagan, Clinton, Bush2, and Obama; 6 for Nixon; 5 for Johnson; 4 for Carter, Bush1; 3 for Kennedy; 2 for Ford.

These patterns are interesting. A possible explanation is that most of the institutional growth of the federal government took place from the New Deal through the 1970s. Since then, while the federal government has continued to expand in terms of budget and employment, there has been less innovation like the creation of new agencies, and hence less need for judicial consideration of novel issues. But we do not want this issue to obscure the major takeaway: even in the face of declining participation rates, presidents remain major players in Supreme Court litigation. Over the course of the terms in our study, for example, they participated in nearly double the number of cases of all fifty of the states combined.  

### III. President Win Rates

74 3,794 versus 2,102 (41.9% versus 23.2%).
Do the data also confirm the conventional story about presidential success in the Court? To begin to answer this question, we calculated the win rate for each president, that is, the fraction of decisions in his favor. Figure 2 summarizes the raw data.

**Figure 2.** Fraction of Decisions in Favor of the President, Ordered Chronologically

Notes:
1. The number in parentheses is the total number of cases in our dataset that the Court decided when the president was in office and for which the Supreme Court Database codes the winner.
2. The bars show the (weighted) mean win rate for each president. The capped lines show the minimum and maximum fractions for each term that the president was in office. Minimums and maximums exclude terms in which the sitting president participated in fewer than 10 cases. For this reason, Ford’s maximum is less than his average success because he won 7 of 8 cases in the 1976 term (87.5%). For purposes of calculating minimum and maximum fractions, the number of Supreme Court terms included is 13 for Roosevelt; 9 for Eisenhower; 8 for Truman, Reagan, Clinton, Bush2, and Obama; 6 for Nixon; 5 for Johnson; 4 for Carter and Bush1; 3 for Kennedy; and 2 for Ford.

On the one hand, the data suggest that the long line of scholarship is right: “Like the Green Bay Packers of the 1960s, the SG rarely loses.” Over the course of the 84 terms and 13 presidents in our dataset, presidents prevailed in nearly two-thirds of their cases (and captured 61% of all

---

75 We show the fraction of decisions. The correlation between decisions for the president and votes for the president is 0.93.
76 The Database codes the winner as “unclear” in 16 cases in our dataset.
77 Black & Owens, supra note 13.
votes). By comparison, the states won significantly fewer of their cases during the same period (53%).

On the other hand, Figure 2 suggests problems with the standard story—notably, the declining win rate since the Reagan administration. Before Reagan, the president prevailed in 65% of his cases and won 61% of all votes; during the Reagan years, those percentages increased significantly to 75% and 68%. Thereafter, they dropped to 60% (decisions) and 58% (votes)—statistically significant declines from the pre-Reagan win rate and, of course, from Reagan's rate. Obama's performance was especially poor. He prevailed in just 50.5% of his cases—a percentage slightly lower than the states' win rate while Obama was in office (55.4%). This is the worst record of any president in our dataset; and it may be the worst since the Zachary Taylor administration, which ended in 1850.

Based on these data, we understand why some commentators blame Obama for his administration's poor showing; they say the Court merely pushed back on aggressive executive policy making. But Figure 2 suggests another possibility: Obama was just the latest victim of a Court growing less and less deferential to the executive branch. In fact—and low as it may be—Obama's win rate is not significantly lower than Bush 2’s in a statistical sense.

Figure 3, which plots the data by term, confirms the secular (downward) trend. Pre- and post-term regressions help us pinpoint its start. From the regressions we learn that the trend is relatively flat until the 1981 term—coinciding with Reagan’s second year in office—when it begins to creep up significantly. Increases in the president’s win rate continue through the 1986 term, Reagan’s penultimate, with the onset of the downward trend around the 1990 term (Bush 1’s third Supreme Court term) and in full swing by 2000 (Bush 2’s first term). Put more precisely, the predicted probability of a president winning in a 1980 term case is over 0.77; by 1990, it drops to 0.70, though remains above the mean predicted value of 0.66. But in 2000, the predicted

---

78 65.1% of 3,778 cases.
79 53.3% of 2,102 cases.
80 We base this statement on a preliminary dataset of all cases of concern to the president, from George Washington forward.
81 E.g., Ilya Shapiro, Obama has Lost in the Supreme Court More than Any Modern President, The Federalist (July 6, 2016), http://thefederalist.com/2016/07/06/obama-has-lost-in-the-supreme-court-more-than-any-modern-president/; Oliver Roeder, Despite this Week’s Victories, Obama Has Struggled at the Supreme Court, FiveThirtyEight (June 28, 2015), http://fivethirtyeight.com/datalab/ despite-this-weeks-victories-obama-has-struggled-at-the-supreme-court/.
82 Again, we show the fraction of decisions. The correlation between decisions and votes is 0.90.
83 We estimated regressions of the president’s win rate (or whether the president won or not) on term (since 1960), each term moving forward. We adapted this strategy from Lee Epstein, Rene Lindstadt, Jeffrey A. Segal, & Chad Westerland, The Changing Dynamics of Senate Voting on Supreme Court Nominees, 68 J. Pol. 296 (2006).
84 In the 1988 term, Reagan was a party in only 4 of 34 “president” cases. The remaining 30 were under Bush 1.
85 The 95% confidence interval is [0.73, 0.81]. This and the predictions that follow are from a logistic regression of whether the president won on term, clustered on term, from the 1980 term forward.
86 The 95% confidence interval is [0.67, 0.73].
87 The 95% confidence interval is [0.63, 0.69].
fraction falls to 0.61;\textsuperscript{88} and in 2010, Obama’s third Supreme Court term, the president’s projected probability of victory is barely 0.50.\textsuperscript{89}

**Figure 3.** Fraction of Decisions in Favor of the President, by Term, 1932-2015

\end{figure}

*Notes:*
1. The hollow circles are the win rates for each term weighted by the number of cases in which the president was a party: the smaller the circle the fewer the total cases.
2. The black line is a LOESS smoothing line for the fraction of decisions in favor of the president.

\textsuperscript{88} The 95\% confidence interval is [0.58, 0.64].

\textsuperscript{89} 0.52 [0.46, 0.57].
IV. Explanations for the Downward Trend

The president is no longer as dominant in the Supreme Court as he was three decades ago. Why? Several possibilities come to mind: (A) greater ideological distance between the Court’s center and recent presidents; (B) more aggressive assertions of executive power by presidents since Reagan; (C) a more aggressive or “activist” Court regardless of the ideology of the president; (D) the emergence in the late 1980s of a specialized Supreme Court bar of equal or even higher quality than the president’s lawyers,\(^{90}\) such that the president’s win rate has declined as the quality of this group has increased.

In what follows we explore each hypothesis. We emphasize “explore” because our goal here is not to reach conclusions with any known degree of certainty (that is, conclusions based on a proper statistical analysis). It is rather to begin to separate the plausible from the implausible. This is a worthwhile undertaking because the explanations have different implications for future administrations. Imagine that recent presidents were especially ideologically remote from pivotal justices. If so, the trend we observed in Figures 2 and 3 could be fleeting should the next president have an opportunity to “move the median” of the Court.\(^{91}\) Now suppose that the Court is simply responding, perhaps appropriately, to aggressive assertions of executive power based on strained interpretations of the Constitution and of statutes. Were future presidents to act less aggressively, their win rate might bounce back. Alternatively, if the Court has become more aggressive toward the president, we want to ask why, and also whether the Court should be encouraged to return to its earlier practice of deference. Finally, if the quality of the president’s lawyers and his opponents’ lawyers are now roughly equivalent, today’s low success rate could be self-sustaining or drop even further.

A. Ideological Divergence

To social scientists, especially political scientists, “it’s all politics, stupid” supplies the answer to the puzzle of variation of ideological outcomes in the Supreme Court,\(^{92}\) and this logic would seem to apply to presidential success rates as well. On this account, when the ideology of the median justice of the Court and the ideology of the president are distant, the president will be less likely to prevail. If this explanation is correct, then the post-Reagan trend against the president would not reflect the Court’s attitude to executive power as such, but instead a growing ideological divergence between the president and the Court.

There are several ways to explore this explanation. Here we use the Judicial Common Space,\(^{93}\) a simple and time-tested route. The general idea is to place presidents and the Court in the same left (liberal)-right (conservative) policy space. To locate the president in this space, we use Poole’s

---

\(^{92}\) See generally Segal & Spaeth, supra note 48.

\(^{93}\) Lee Epstein, Andrew D. Martin, Jeffrey A. Segal & Chad Westerland, The Judicial Common Space, 23 J. L. Econ. & Org. 303 (2007).
Common Space scores\textsuperscript{94} (available for 11 of the 13 presidents in our dataset, Eisenhower-Obama). For the Court, we use the Martin-Quinn scores of the (most likely) median justice transformed to ensure compatibility with the presidents’ scores.\textsuperscript{95} These scores end with the 2013 term.

To assess the hypothesis that the president enjoys greater support from the Court as the distance decreases, we compute the ideological distance as the absolute difference between the president’s and the median justice’s score. Figure 4 provides the raw data for the 11 presidents.

**Figure 4.** Ideological Distance between the President and the Court’s Median Justice, Ordered Chronologically

*Note:*
1. The bars show the (weighted) mean win rate for each president. The capped lines show the minimum and maximum fractions for each term that the president was in office. Minimums and maximums exclude terms in which the sitting president participated in fewer than 10 cases. E.g., we exclude Kennedy’s one case in the 1963 term when we calculated the minimum and maximum fractions, though the one case is included in Kennedy’s mean.
2. Obama’s data are through the 2013 term.

On the surface, ideology could provide an explanation of variation in the president’s success or even the downward trend. The ideological distances for the last three presidents were all significantly above the mean. But so was the ideological distance for Reagan and he had a high win rate. More generally, the correlation between win rate and ideological distance is negative, as we would expect, but modest (0.17); and term-by-term regressions of the win rate on ideological

\textsuperscript{94} The Common Space scores are available at http://voteview.com/readmeb.htm.
\textsuperscript{95} The Martin-Quinn scores are here: http://mqscores.berkeley.edu/measures.php. And the transformed scores are here: http://epstein.wustl.edu/research/JCS.html.
distance show that while the coefficient is negative, it is not statistically significant. Very roughly, it seems that earlier presidents were usually liberal (by modern standards) and so was the Court. Since the 1970s, presidents have become more polarized—Democrats are more liberal and Republicans are more conservative—while the Court has remained somewhere in the middle (though more conservative than in the earlier period). Ideological clashes may have resulted in fewer victories for the president, but if so, the difference over time was small.

Of course, it is possible that the low correlation between outcomes and ideological distance reflects within-president variation, reflecting changes in the composition of the Court that the mean masks (see the capped lines in Figure 4). Nixon is an extreme example. For the 32 cases in his first term (1968), the mean distance between Nixon and the Court is the largest (0.66) in our dataset; by 1971 it was below the mean (0.22) and it fell even lower (to 0.15) in 1972 (Nixon’s lower bound). But this variation has limited explanatory power.

The upshot is that ideology may provide a partial explanation for variation in presidential performance. But we doubt it tells the whole story.

B. Executive Overreach

From the Court’s perspective, executive overreach means that an executive action exceeds the legal or constitutional limits of the executive’s power. According to this theory, the post-Reagan trend against presidents reflects not any change in how the Court decides cases, but a separate causal trend of executive overreach: each post-Reagan president overreaches more than the prior president.96 One commentator, for example, claimed that the Supreme Court ruled against the Bush administration in Hamdan v. Rumsfeld97 because of Bush’s aggressive claims of executive power.98 Applying a doctrinal standard that did not change over time, the Court then necessarily rules against each succeeding president at a higher rate.

To investigate this theory, we count up executive orders, which are documents that presidents use to direct subordinates in the executive branch to take actions. This measure of executive overreach is admittedly imperfect. Executive orders are of varying significance; and some are more controversial than others. Truman’s order to seize the steel mills, for example, falls on the controversial side,99 while Obama’s order to change the name of the “National Security Staff” to the “National Security Council staff,” seemingly far less so.100 Moreover, presidents do not always use executive orders to accomplish their goals. President Obama’s controversial immigration orders—DACA and DAPA—took the form of directives issues by the Department of Homeland Security (at Obama’s behest) rather than executive orders.101 Still, scholars have used executive order counts to

96 See, e.g., Shapiro, supra note 81.

measure executive power, and we shall do the same. Table 1 presents the data for the presidents.

</table>

Notes:
1. Averages are rounded.
2. We show the median instead of the mean because FDR’s numbers are so extreme.

At first glance, there does not appear to be a strong relationship between win rates and the number of executive orders (or their length). FDR issued far more executive orders than any other President yet his win rate is about average. Obama issued the fewest but he has the worst win rate in our dataset.

Various statistical analyses confirm the lack of a meaningful relationship between this measure of executive aggression and win rates—including logits of whether the president won or not on the measures (with and without FDR; and clustering on president) and regressions of the win rate on the measures (again, with and without FDR). Last but not least, the highest correlation between

---

104 We exclude FDR in some regressions because of his unique position as the founder of the modern administrative state.
win rates and any of the measures is a positive 0.22, not negative as we might expect (for average orders/pages, excluding FDR).

There were many controversies about executive overreaching during the last two administrations. Yet we find no evidence that the Court ruled more frequently against presidents who engage in more such overreaching. This could be due to the weakness of executive orders as a measure of presidential aggressiveness, but the results dovetail with intuition and conventional wisdom. Of all the presidents in our dataset, Franklin Roosevelt and Ronald Reagan were clearly the most assertive. Roosevelt created the modern administrative state and threatened to pack the Court. Reagan initiated a mirror revolution in favor of deregulation, which resulted in numerous political and legal clashes. Yet these two presidents enjoyed respectable win rates.

C. A More Aggressive Supreme Court

The mirror-image explanation is that the Court, not the executive, has become more aggressive. According to this theory, the Court no longer defers to the president on matters on which it deferred in the past. A parallel debate concerns the Court’s ideological activism. Critics argue that justices on the Court have become too enthusiastic about striking down statutes, often based on ideological disagreement rather than on the correct application of constitutional norms.

The critics have not tried to offer a systematic explanation for why the Court has become more “activist,” usually instead blaming individual justices for exceeding the bounds of the judicial role. But explanations are easy to imagine. One explanation, for example, is that as political polarization has increased and thrown the political branches into gridlock, the public has placed more faith in the Supreme Court. This public trust has in turn enhanced the self-confidence of the justices.

A similar argument could explain why the Court has become more activist in the sense of anti-executive. Controversies about executive power have damaged public confidence in the executive, allowing the Court to assert itself with less fear of retaliation. Another explanation is that with increasing polarization and gridlock in Congress and the executive branch, political retaliation against an overreaching Court by those branches becomes less credible.

To explore these ideas, we use as a measure of judicial “activism” the rate at which the Court strikes down federal statutes every term. If the Court has a strong conception of its role as a guarantor of constitutional values, it will act aggressively against Congress as well as against the executive, and so will strike down federal statutes just as it rules against the executive. Figure 5 provides the data.

Figure 5. Percentage of All Cases Invalidating Federal Laws

---

105 See, e.g., Cass R. Sunstein, Radicals in Robes (2009); Thomas M. Keck, The Most Activist Supreme Court in History (2004); The Rehnquist Court: Judicial Activism on the Right (Herman Schwartz ed., 2002).

Notes:
1. The horizontal axis displays the number of federal law invalidations (as identified in the U.S. Supreme Court Database) as a percentage of all orally argued cases for a president (in Panel A) or a Chief Justice era (Panel B) (excluding per curiam decisions and cases in which the Court invalidated a state or local law).
2. The parentheses contain the number of orally argued cases.

Figure 5 provides some suggestive evidence for the “activist Court” hypothesis. Panel A shows the rate of statutory invalidation by president. There is a definite post-Reagan trend toward more frequent invalidation, and a weaker trend over the longer term—interrupted by a period of activism during the Johnson and Nixon administrations. Panel B shows the rate of statutory
invalidation by Chief Justice era. The trend toward greater statutory invalidation is evident in this panel as well.  

While the data must be taken with many grains of salt, it is consistent with the view, expressed by many authors, that the Supreme Court has become significantly more self-confident and powerful over the years. It turns out that the Court has exercised that power not only to strike down federal statutes, but also to block executive actions.

D. Higher Quality Opponents

Many experts speculate that the president wins (or at least used to win) so frequently because of the high-quality lawyers who represent him. In some of our cases, the president hired his own counsel—for example, Clinton retained Robert S. Bennett—a famous litigator—to argue on his behalf in Clinton v. Jones. But in the vast majority of cases, the president’s attorneys work in the Office of the Solicitor General. To be sure, not all members of the that office are especially talented; in fact, some have been notoriously inept. Caplan reports that Franklin Roosevelt’s first SG, J. Crawford Biggs, was so “unqualified for the job” that the justices sent “word” to the president that he should not allow Biggs “to argue again if the Administration wanted to win any cases before the Court.” For the most part, though, SGs and the members of their team have been of such uniformly high quality that even critics of the Obama administration do not blame the OSG for the president’s poor record. As one put it,

To be clear, I’m not saying that the government’s lawyers are sub-par. Solicitor General Don Verrilli and his predecessors (including Kagan herself) are very well respected, and their staffs are populated by people who graduated at the top of elite law schools and clerked on the Supreme Court. If they’re not qualified to represent the government, nobody is.

If the quality and expertise of the president’s lawyers has not changed since the 1930s, what has? Lazarus suggests that the counsel opposing the president are now so skilled that they have

---

110 One complication is that while the Roberts Court has struck down federal statutes at a higher rate than many earlier courts, it has also taken fewer cases, so that the absolute number of statutes that have been struck down does not stand out as much. See Keith E. Whittington, The Least Activist Supreme Court in History? The Roberts Court and the Exercise of Judicial Review, 89 Notre Dame L. Rev 2219 (2014). Whittington’s conclusion that the Roberts Court is “least activist” also is due to his incorporation of invalidations of state as well as federal statutes into his empirical analysis. With our focus on interbranch competition in the national government, we think the better measure of activism involves federal statutes alone. We would also need, ideally, to control for the importance of the statute.

114 Shapiro, supra note 81.
offset the president’s usual advantages. Lazarus finds that for most of the 20th century—the majority of the terms covered in our study—very few expert “repeat-player” attorneys regularly argued before the Court.

No longer. Beginning in 1985, “a private Supreme Court Bar capable of replicating the expertise of the SG’s office began to develop.” Sidley Austin apparently got the ball rolling in 1985 when it hired former SG Rex to create a Supreme Court appellate practice. Other large private sector firms followed suit, hiring other former SGs and attorneys with experience in the OSG. They have been joined by spin-off firms and even tiny operations devoted to Supreme Court advocacy. Regardless of the firms’ size, many of the attorneys continue to be alumni of the OSG or of clerkship positions in the Supreme Court, suggesting a revolving door of sorts. Just as members of Congress and agencies move between their jobs and the businesses they once regulated, so too do former clerks and members of the OSG.

Lazarus, Reuters, and others argue that this new elite Supreme Court bar is so good that the OSG’s “virtual monopoly on advocacy expertise” has disappeared. If they are correct, we would expect to see the president losing more cases than he did in the days when opposing counsel were almost all one-shot players. The explanation is not just that the SG no longer has superior expertise; it could also be that the specialized bar, as lawyers who repeatedly appear before the Court, cares about its reputation as much as the SG cares about the government’s reputation. If the specialized bar screens out weak cases, then the private-litigant win rate should increase (and the president’s win rate should decline).

Existing studies offer mixed support for this explanation. McGuire’s study of the 1977-1982 terms—before the emergence of the new elite Supreme Court bar—hints at its merit. McGuire found that the SG prevailed at a higher rate than private lawyers with similar experience. Lazarus, however, critiques McGuire’s study on several grounds; and a more recent analysis by Black and Owens suggests that even after controlling for relevant factors, including attorney expertise, SG lawyers have a 0.14 greater predicted probability of winning their case than similarly experienced attorneys. But this study too has its problems: notably, it covers only the 1979-2007 terms; and it matches the SG and its opponents only on the attorney and not on the law firm, ignoring Lazarus’s argument that “someone…it’s always the first time but who is affiliated with an [expert] organization of attorneys” will be the beneficiary of collective wisdom of the

organization. The Black and Owens approach also would have missed cases in which a first-time arguer paired up with a professional Supreme Court litigator. Such was Menominee Indian Tribe of Wisconsin v. United States, in which an Oregon firm represented the Tribe but Paul Clement, a former SG and the quintessential example of a specialized Supreme Court lawyer, was on the firm’s brief.

In Table 2, we compare the president’s opponents in two terms, 1985 (right before the rise of the specialized Supreme Court bar) and 2015 (30 years later). Each row includes a measure of the Supreme Court-related experience of the attorneys of the president’s opponents.

Table 2. Comparison of Attorneys in the 1985 and 2015 Terms

<table>
<thead>
<tr>
<th>Attorney Has Appeared Before Supreme Court in at Least One Prior Case</th>
<th>1985 Term</th>
<th>2015 Term</th>
</tr>
</thead>
<tbody>
<tr>
<td>Attorney Has Signed at Least One Prior Brief in a Supreme Court Case</td>
<td>26.1</td>
<td>52.2</td>
</tr>
<tr>
<td>Attorney is a former Supreme Court clerk or SG Attorney</td>
<td>47.8</td>
<td>87.0</td>
</tr>
<tr>
<td>A Major Firm or Organization is on the Brief</td>
<td>8.7</td>
<td>30.4</td>
</tr>
<tr>
<td>1985 Term</td>
<td>28.3</td>
<td>60.9</td>
</tr>
</tbody>
</table>

Notes:
1. The number of cases is 46 for the 1985 term and 23 for the 2015 term.
2. For all rows, the difference between the figures for 1985 and 2015 is statistically significant, at $p < .05$.
3. The first three rows focus on the attorney who argued the case; the last row counts any major firms or organizations on the brief. Major firms/organizations include repeat-player interest groups (in our dataset, e.g., ACLU, AFL-CIO, NAACP LDF, Pacific Legal Foundation, Public Citizen Litigation Group) but exclude governments, public defenders, law school clinics, and regional legal services.
4. “At Least One Prior Brief” in row 2 includes amicus curiae and party briefs.

Our data confirm Lazarus’s and Reuter’s observation that the composition of the Supreme Court bar has changed radically over the last three decades. In the 1980s, most attorneys opposing the president were one-shot players with little inside knowledge of the ways of the Court. Lazarus, for example, found that 76% of lawyers arguing in the 1980 term were first-timers; we find much the same for the 1985 term (100%-26%=74%). By 2000, the percentage had reduced to 59% in Lazarus’s data; and by 2015, to only 48% in ours. Private litigants seem to have figured out that they do better if they hire lawyers with inside knowledge. The participation of lawyers who are former Supreme Court clerks or SGO attorneys nearly quadrupled over our time period.

The question, though, is whether the increase in quality and experience in opposing counsel helps account for the decline in the president’s win rate. As it turns out, some of the indicators of quality might do just that. The president prevailed in 80% of the cases when his attorney faced a first-time litigator but in only 58% when his opponent had argued before; and the data are similar

129 Id.
for prior briefs (89% versus 62%). In logit regressions controlling for term, the quality measures exert a positive, though not statistically significant, effect on the president’s win rate.

Other than reporting these (promising) results, we cannot say more without further analysis. First, our sample size is quite small; second, the data are so severely imbalanced that they beg for the sort of matching analysis that Black & Owens conducted (though with more attention to the lawyers and firms, as we noted above); third, we note differences in kind between the lawyers of today and yesterday. For example, in the 1985 term, groups and movement lawyers tended to represent their own interests; today, many seem to hire big firms to do the work for them. Finally, we lack a theory of judicial behavior that would account for the importance of lawyering in the Supreme Court.

V. Conclusion

Presidents used to dominate in the Supreme Court; they no longer do. They do no better than other litigants. Our major goal has been to expose and document this change, which we suspect will be a matter of debate and discussion for some time to come. 130

Among the possible explanations for the post-Reagan decline in presidential win rates, two turn out to be promising. The first is that the Court has become more aggressive over the last three decades. As its institutional self-confidence grew, it became increasingly willing to defy the executive as well as Congress. The second is that a specialized Supreme Court bar has emerged, nullifying the advantage to the president formerly conferred by the SG’s office.

Each explanation raises additional questions. If the Court has become more aggressive, why now? A possible answer traces this development to polarization. Polarization in the public has led to polarization in Congress, which has caused gridlock. In order to break the gridlock, presidents have engaged in controversial unilateral actions, which have undermined, in some instances, their political standing. With the political branches hobbled, the Court does not fear retaliation if it rules against them, as it has in the case of statutory challenges as well as executive actions.

This theory also raises questions about whether the Court is fulfilling its judicial function. On one view, the Court’s aggressiveness toward the president reinforces worries about an out-of-control, imperial judiciary, 131 one that hobbles executive action as well as legislation. But critics of executive power are more likely to conclude that the Court has risen to the challenge of the imperial presidency.

The Supreme Court bar theory also raises questions. One is the question of timing. Why didn’t a specialized bar emerge in the 1970s or 1960s, or earlier? With such high stakes in Supreme Court litigation, private parties—particularly businesses—should be willing to shell out big money to hire the best lawyers. But this may be the explanation: the enormous pay gap between government

131 See Ran Hirschl, Towards Juristocracy: The Origins and Consequences of the New Constitutionalism (2007) (documenting this trend in several countries).
lawyers and private lawyers did not open up until the 1980s. Before then, government lawyers faced a smaller inducement to enter the private sector.\(^{132}\)

And what should we make of this phenomenon? Does the development of the private bar overcome an unfair advantage in the SG’s office, one that allowed the executive branch to win cases that it should have lost? Or are the conscientious but underpaid and overworked bureaucrats in the SG’s office now outmatched by hired guns?\(^{133}\) We should also worry about the emergence of a revolving door. Lawyers who in the past made a career in government after serving as Supreme Court clerks and SG lawyers now rotate into the private sector where they use their taxpayer-funded expertise to defeat their former employer.
