THE MYTH OF FOURTH AMENDMENT CIRCULARITY

Matthew B. Kugler* and Lior Jacob Strahilevitz**

84 UNIVERSITY OF CHICAGO LAW REVIEW (forthcoming 2017)

ABSTRACT

The Supreme Court's decision in *Katz v. United States* made peoples' reasonable expectations of privacy the touchstone for determining whether state surveillance amounts to a search under the Fourth Amendment. Ever since *Katz*, Supreme Court justices and numerous scholars have referenced the inherent circularity of the expectations of privacy framework: People's expectations of privacy depend on Fourth Amendment law, so it is circular to have the scope of the Fourth Amendment depend on those same expectations. Nearly every scholar who has written about the issue has assumed that the circularity of expectations is a major impediment to having the scope of the Fourth Amendment depend in any way on what ordinarily people actually expect. But no scholar has tested the circularity narrative's essential premise, which is that when salient, well-publicized changes in Fourth Amendment law occur, popular sentiment falls into line.

Our paper conducts precisely such a test. We conducted surveys on census-weighted samples of US citizens immediately before, immediately after, and long after the Supreme Court's landmark decision in *Riley v. California*. The decision in *Riley* was unanimous and surprising. It substantially altered Fourth Amendment law concerning the privacy of peoples' cell phone content, and it was a major news story that generated relatively high levels of public awareness in the days after it was decided. We find that immediately after the *Riley* decision the public began to expect greater privacy in the contents of their cell phones, though the effect was small and appears to have been confined to the 40% of our sample that reported having heard of the *Riley* decision. One year after *Riley*, these heightened expectations had disappeared completely. There was no difference from baseline two years after *Riley* either, with privacy expectations remaining where they were prior to the decision. Our findings suggest that privacy expectations are far more stable than judges and commentators have been assuming. Even in the ideal circumstance of a clear, unanimous, and widely reported decision, circularity in Fourth Amendment attitudes is both weak and short-lived. In the longer term, Fourth Amendment circularity appears to be a myth. The paper concludes by comparing the public's response to *Riley* with its reaction to the Supreme Court's contemporaneous *Hobby Lobby* decision and situates our results within the political science literature on attitudinal responses to significant Supreme Court decisions.

It is very difficult to find any proposition in Fourth Amendment law to which every judge, lawyer, and scholar subscribes. One striking point about which nearly everyone – left, right, and center – agrees, however, is that there is a degree of circularity in the *Katz* “reasonable expectations of privacy” test. Among those expressing concern about this circularity are Justices Samuel Alito, Anthony Kennedy, Antonin Scalia and John Paul Stevens, Judges Alex Kozinski, Richard Posner, and George MacKinnon, and Professors Jed Rubenfeld, Dan Solove, Amitai Etzioni, Erwin Chemerinsky, David Sklansky, Orin Kerr, Michael Abramowicz, Mary Coombs, and Paul Schwartz.¹ In this paper we show that this widely shared concern is misplaced.

Justice Harlan’s opinion in *Katz v. United States* makes a person’s reasonable expectations of privacy the touchstone for determining whether police surveillance amounts to a search and, therefore, is subject to restrictions under the Fourth Amendment.² Under *Katz* and the numerous cases that follow its approach, the government conducts a search when it invades an “expectation [of privacy]...that society is prepared to recognize as ‘reasonable.’”³ If the government’s surveillance intrudes upon such an expectation, the Fourth Amendment is implicated and the government must either get a search warrant or satisfy one of the limited exceptions to the warrant requirement. If the government’s surveillance does not implicate a reasonable expectation of privacy, then the Fourth Amendment is inapplicable and no warrant is required.

The exact meaning of *Katz*’s reasonable expectations of privacy test is controversial, but its text has led some scholars to argue that the test should depend in part on how everyday members of the public think about

¹ See *infra* text accompanying notes 7-25.

² *Katz v. United States*, 389 U.S. 347, 361 (1967) (Harlan, J., concurring) (stating that police conduct amounts to a search, thereby implicating the Fourth Amendment, when “a person [exhibits] an actual (subjective) expectation of privacy, and [when] the expectation [is] one that society is prepared to recognize as ‘reasonable.’”). The test from Justice Harlan’s concurrence subsequently became the key Fourth Amendment inquiry, embraced repeatedly by the Supreme Court over time. See, e.g., *California v. Ciraolo*, 476 U.S. 207, 211 (1986) (“The touchstone of Fourth Amendment analysis is whether someone had a “constitutionally protected reasonable expectation of privacy.”) (citing the Harlan concurrence in *Katz*); *Kyllo v. United States*, 533 U.S. 27, 32 (2001) (describing the Supreme Court majority’s application of Justice Harlan’s *Katz* test in several cases).

³ *Id.*

privacy.⁴ And in some prominent post-*Katz* cases, the Supreme Court has said it is doing exactly that.⁵ The problem that many have identified with this approach to *Katz* is that reasonable people should expect the privacy rights granted to them by the courts. So expectations define the scope of legal protection, but the legal protections themselves should define the expectations.

This potential circularity gives rise to a practical problem. Once the state begins using an investigative technique, and especially once the courts authorize the state to do so, ordinary people's expectations of privacy may adjust. Thus, even if people expected privacy in a context at some earlier point in time, subsequent actions by the government can erode those expectations, enabling the state to conduct invasive surveillance in the future without having to secure a warrant. If this understanding of expectations is correct, the Fourth Amendment provides little protection against a government that acts strategically; all it need do is move slowly and publicize what it is doing. Further, the judicial determination of whether an expectation of privacy exists would be largely empty; even if the court gets the answer "wrong," public expectations would in time adapt to make it "right." For those who argue that the reasonableness of a privacy expectation should depend on whether the expectation is widely shared, this is an especially salient problem. If public expectations are mostly just a function of whatever the Supreme Court said last, then for the Court to account for such expectations would result in it talking to itself.

The Fourth Amendment circularity hypothesis is intuitive and easy to grasp. There are just two problems with the circularity story: (1) there is no empirical evidence supporting it, and (2) an empirical literature in political science provides ample reason to doubt it. In this paper, we have gathered and analyzed new data that suggest that popular expectations of privacy are very stubborn. Though expectations move a little right after a landmark Supreme Court Fourth Amendment decision substantially changes the law,

⁴ See, e.g., CHRISTOPHER SLOBOGIN, *PRIVACY AT RISK: THE NEW GOVERNMENT SURVEILLANCE AND THE FOURTH AMENDMENT* (2007); Matthew B. Kugler & Lior J. Strahilevitz, *Actual Expectations of Privacy, Fourth Amendment Doctrine, and the Mosaic Theory*, 2015 SUP. CT. REV. 205, 219, 230 (2016); Christine S. Scott-Hayward et al., *Does Privacy Require Secrecy? Societal Expectations of Privacy in the Digital Age*, 43 AM. J. CRIM. L. 19 (2015); Christopher Slobogin & Joseph E. Schumacher, *Reasonable Expectations of Privacy and Autonomy in Fourth Amendment Cases: An Empirical Look at "Understandings Recognized and Permitted by Society,"* 42 DUKE L.J. 727, 732 (1993).

⁵ See *supra* note 16 and accompanying text.

within a span of months they snap right back to where they were beforehand and they remain stable thereafter. As best we can tell, the circularity of reasonable expectations of privacy is a myth.

Part I of the paper presents the problem of circularity. At stake in this discussion is the feasibility of incorporating public expectations into the doctrine. If expectations are independent of current case law, then looking to public expectations can provide a correcting impulse against an out of touch judiciary. If, on the other hand, expectations merely reflect what courts have said, then there is no point to considering public attitudes; no information would be gained. The section begins by explaining the Supreme Court's concern that expectations of privacy would become an empty concept, and that a government could strategically condition the populace to accept ever-greater privacy invasions. We then cite many Fourth Amendment scholars expressing the same concern. Lastly, we examine a literature from political science and psychology commenting on public reactions to Supreme Court decisions. This literature informed our skepticism that the public would uncritically mirror the Court's rulings.

In Part II we describe the case at the core of our study: *Riley v. California*. The case established a new rule for the searching of electronic devices incident to arrest, what can fairly be read as a "computers are different" standard. This case was perfectly suited to prompting a major change in public expectations. The ruling was clear, it was broad, it was surprising, it was unanimous, and it prompted a torrent of media coverage. As Fourth Amendment cases go, we could not have hoped for better; it stacked the deck in favor of finding a change of expectations, *and yet no lasting change was observed*.

In Part III we present the empirical study itself. We recruited census-representative participants in four waves: one right before the decision, one right after, a one-year follow-up, and a two-year follow-up. What we found was a small shift in the direction of the Court's decision in the survey conducted immediately after the decision came down. But this shift was 1.) specific to the exact question in *Riley* and did not generalize to related questions, 2.) was present only among those who reported having heard of the decision, and 3.) disappeared the following year. Put another way, the Supreme Court manage to move privacy expectations only slightly and only for a very short period of time. Based on these data, circularity does not seem to be a problem.

In Part IV, we examine the implications of these data for Fourth Amendment doctrine and relate our findings back to the political science literature on the effects of Supreme Court decisions on public attitudes. We also show that a nearly simultaneous Supreme Court decision, *Hobby Lobby*

v. Burwell, had a short-lived polarizing effect on the public. This finding underscores the complicated interplay between the Supreme Court and the general public and adds further reason to believe that circularity is neither strong nor common.

I.) THE (ALLEGED) PROBLEM OF CIRCULARITY

Prior to this study, many legal thinkers were concerned by the potential for circularity. Not long before his appointment to the federal bench, Richard Posner observed “it is circular to say that there is no invasion of privacy unless the individual whose privacy is invaded had a reasonable expectation of privacy; whether he will or will not have such an expectation will depend on what the legal rule is.”⁶ This sums up the alleged problem of circularity perfectly: Reasonable people should not expect more privacy than the courts have told them will be protected. If the level of privacy expected by society is both the cause and consequence of Fourth Amendment jurisprudence, then the entire area of law reduces to a discussion of chickens, eggs, and primacy.

The circularity of the *Katz* inquiry is an idea with a long and distinguished pedigree. The Supreme Court’s first recognition of the potential circularity problem arose in an opinion called *Rakas*, decided in 1978. In footnote 12, the Court talked about the circularity problem:

[I]t would, of course, be merely tautological to fall back on the notion that those expectations of privacy which are legitimate depend primarily on cases deciding exclusionary-rule issues in criminal cases. Legitimation of expectations of privacy by law must have a source outside of the Fourth Amendment, either by reference to concepts of real or personal property law or to understandings that are recognized and permitted by society.⁷

The Court is noting that it is illogical and unappealing to base whether someone has a reasonable expectation of privacy on whether the court cases say he or she does.⁸ To avoid this kind of *doctrinal circularity*, courts are to

⁶ Richard A. Posner, *The Uncertain Protection of Privacy by the Supreme Court*, 1979 SUP. CT. REV. 173, 188 (1979)

⁷ *Rakas v. Illinois*, 439 U.S. 128, 143 n.12 (1978).

⁸ See, e.g., *Sparing v. Village of Olympia Fields*, 266 F.3d 684, 689 (7th Cir. 2001) (referring to the “unmistakable circularity” of such an approach); *United States v. Johnson*, 561 F.2d 832, 851 (D.C. Cir. 1977) (Mackinnon, J., concurring) (“*Katz*.”

determine whether a reasonable expectation of privacy exists based on considerations extrinsic to Fourth Amendment doctrine, such as property law and popular expectations.

But looking to public attitudes only escapes circularity if one believes that those attitudes won't generally be driven by the doctrine itself. Within a year of *Rakas*, the Supreme Court would start worrying about the problem of feedback between what courts say and what the public expects. We will refer to this hypothesized feedback as *attitudinal circularity*, the idea that "understandings that are recognized ... by society" will themselves be determined by legal pronouncements. If attitudinal circularity is a real concern then one of the solutions the *Rakas* Court offered for the problem of doctrinal circularity is no solution at all: the content of the doctrine would still depend on the content of the doctrine, just with the additional step of popular expectations being influenced by, and in turn influencing, doctrine. As the parade of scholars expressing concern over this kind of circularity indicates, there is an intuitive plausibility to the notion that the privacy expectations of reasonable people, those expectations to which *Katz* refers, are dependent on the pronouncements of courts.

A. *The Development of Circularity Concern*

The Supreme Court's first comments on attitudinal circularity appeared in *Smith v. Maryland*, which involved the government's use of a pen register to determine what outgoing calls were being placed from a robbery suspect's home.⁹ The Court in *Smith* applied the *Katz* framework yet, in the doing so, the majority made the following observation:

Situations can be imagined, of course, in which *Katz*' two-pronged inquiry would provide an inadequate index of Fourth Amendment protection. For example, if the Government were suddenly to announce on nationwide television that all homes henceforth would be subject to warrantless entry, individuals thereafter might not in fact entertain any actual expectation of privacy regarding their homes, papers, and effects. . . . In such circumstances, where an individual's subjective expectations had been

... incorporates a fair amount of circularity. One will have a reasonable expectation of privacy over those areas that courts tell him he may reasonably expect to be private." See DAVID L. FAIGMAN, CONSTITUTIONAL FICTION: A UNIFIED THEORY OF CONSTITUTIONAL FACTS 25 (2008).

⁹ 442 U.S. 735 (1979).

“conditioned” by influences alien to well-recognized Fourth Amendment freedoms, those subjective expectations obviously play no meaningful role in ascertaining what the scope of Fourth Amendment protection was.

In determining whether a “legitimate expectation of privacy” existed in such cases, a normative inquiry would be proper.¹⁰

Here the Court is bringing attitudinal circularity to the forefront. The hypothetical example chosen by the Court posits that the government’s action (a frightening, Orwellian announcement that reaches millions of Americans) changes the attitudes of the citizenry. After the announcement, expectations of privacy have dissipated, and the government can invoke the (now) low privacy expectations of the citizenry if any lawyer tries to challenge the legality of the new policy in court. Such hypothetical (and unrealistic) circumstances could indeed create a logical problem for the doctrine.¹¹ This hypothetical attacks the idea that popular attitudes are largely indifferent to state action, which seemed intuitive to the Court in *Rakas*. Therefore the clever *Rakas* remedy of looking at people’s beliefs no longer helps resolve matters. To deal with this attitudinal circularity problem the Court would need to ignore people’s actual attitudes and instead answer hard normative questions about what level of privacy people ought to expect.

That said, it is worth underscoring that there are no documented instances of the federal government acting in a manner as brazen as what is described in the *Smith* hypothetical.¹² There is presumably a first time for everything, but the *Smith* hypothetical would be unprecedented in this

¹⁰ *Id.* at 740 n.5.

¹¹ See *United States v. Scott*, 450 F.3d 863, 867 (9th Cir. 2005) (Kozinski, J.) (“imposing such a regime outright ... can contribute to the downward ratchet of privacy expectations.”); *United States v. Johnson*, 561 F.2d 832, 851 (D.C. Cir. 1977) (MacKinnon, J., concurring) (*Katz* “incorporates a fair amount of circularity. One will have a reasonable expectation of privacy over those areas that courts tell him he may reasonably expect to be private. Reference to another standard than plain view is also required.”).

¹² The initiation of mandatory baggage screening for airline passengers in January of 1973 is a somewhat close example, though at the time such screening began, regular air travel was a luxury out of reach for most Americans. See generally John Rogers, *Bombs, Borders, and Boarding: Combatting International Terrorism at United States Airports and the Fourth Amendment*, 20 SUFFOLK TRANSNATL. L. REV. 501, 507 (1997) (discussing the history of baggage screening).

country. Setting it aside, popular expectations could easily be sufficiently impervious to changes in the law or police practices to allow the kinds of doctrinal uses referenced in *Rakas*. The proper empirical question is whether the kinds of governmental actions that we regularly see, such as new statutes or Supreme Court opinions, can meaningfully move attitudes.

In its post-*Smith* pronouncements the Court has continued to refer to the Fourth Amendment's circularity problem, but in terms that make it harder to determine whether the Court is referencing doctrinal circularity or attitudinal circularity. In the Court's 2001 *Kyllo* opinion the majority observed that the "*Katz* test—whether the individual has an expectation of privacy that society is prepared to recognize as reasonable—has often been criticized as circular, and hence subjective and unpredictable."¹³ Subjectivity and unpredictability could be a problem associated with either doctrinal uncertainty (the judges get to declare the law is whatever the law they say it is) or attitudinal uncertainty (what the law is depends on how judges think people are reacting, an inquiry that is in and of itself subjective and hard to predict). More recently, Justices Kennedy, Alito, and Stevens have all opined on the Fourth Amendment's circularity problem, referencing the issue in ways that sometimes hint that a particular form of circularity is on their mind and sometimes in more ambiguous terms.¹⁴

¹³ *Kyllo v. United States*, 533 U.S. 27, 34 (2001)

¹⁴ *Jones v. United States*, 132 S. Ct. 945, 962 (2012) (Alito, J., concurring) ("The *Katz* expectation-of-privacy test avoids the problems and complications noted above, but it is not without its own difficulties. It involves a degree of circularity, and judges are apt to confuse their own expectations of privacy with those of the hypothetical reasonable person to which the *Katz* test looks. In addition, the *Katz* test rests on the assumption that this hypothetical reasonable person has a well-developed and stable set of privacy expectations. But technology can change those expectations. Dramatic technological change may lead to periods in which popular expectations are in flux and may ultimately produce significant changes in popular attitudes.") (citations omitted); Justice Kennedy, *City of Los Angeles v. Patel* (Mar 3, 2015), Oral Argument Transcript, available at 2015 WL 888287, at *13 ("If you prevail in this case and a member of the Court sits down to write the opinion, does he or she have to use the phrase "reasonable expectation of privacy" and say there is no reasonable expectation of privacy in our society, in our culture, in our day, or do we just forget that phrase? In -- in a way, as we all know it's circular, that if we say there is a reasonable expectation, then there is."); *Samson v. California*, 547 U.S. 843, 863 (2006) (Stevens, J., concurring) ("Nor is it enough, in deciding whether someone's expectation of privacy is 'legitimate,' to rely on the existence of the offending condition or the individual's notice thereof. The Court's reasoning in this respect is entirely circular. The mere fact that a particular State refuses to acknowledge a parolee's privacy interest cannot mean

More broadly, the Supreme Court has been all over the map in terms of its approach to the Fourth Amendment.¹⁵ In some of its decisions, the Court's sense of popular expectations plays a significant or even decisive role, though invariably the Court is relying on justices' educated guesses about public expectations rather than scientific data.¹⁶ In other cases, the Court essentially ignores these expectations or insists they are irrelevant.¹⁷ The purported circularity of expectations of privacy may be one reason (among others) why the Court has never committed itself to a consistent methodology that is tied to popular understandings of Americans' control over their persons, houses, papers, and effects.¹⁸

B. *The Scholarly Consensus on Attitudinal Circularity*

Circularity has been a major point of discussion in Fourth Amendment scholarship, and we can identify a great many instances of well-regarded scholars articulating the attitudinal circularity. These scholars include Amitai Etzioni,¹⁹ Orin Kerr,²⁰ Jed Rubenfeld,²¹ Dan Solove,²² Erwin

that a parolee in that State has no expectation of privacy that society is willing to recognize as legitimate—especially when the measure that invades privacy is both the *subject* of the Fourth Amendment challenge and a clear outlier. With only one or two arguable exceptions, neither the Federal Government nor any other State subjects parolees to searches of the kind to which petitioner was subjected. And the fact of notice hardly cures the circularity..." (citation omitted).

¹⁵ See *United States v. Maynard*, 615 F.3d 544, 558 (D.C. Cir. 2010), *affirmed sub. nom.* *United States v. Jones*, 565 U.S. 400 (2012); Orin S. Kerr, *Four Models of Fourth Amendment Protection*, 60 STAN. L. REV. 503, 504-08 (2007).

¹⁶ *Id.* at 508-11 (discussing Supreme Court cases that follow what Kerr calls the "probabilistic model," including *Bond v. United States*, *Minnesota v. Olson*, and *California v. Ciraolo*); see also *City of Ontario, Cal. v. Quon*, 560 U.S. 746, 757-60 (2010) (using employees' expectations, based on their understanding of the law, policies, and technologies, to determine the scope of the Fourth Amendment).

¹⁷ *Id.* at 511-12 (discussing Supreme Court cases that treat popular expectations as irrelevant, including *Illinois v. Caballes*, *United States v. Miller*, and *United States v. Ross*).

¹⁸ See generally *id.* at 544 (noting that the Supreme Court is most likely to adhere to the probabilistic model of what government conduct constitutes a search when a group of strongly held "social norms that are difficult for the government to manipulate" and less likely to adhere to the model in other circumstances).

¹⁹ Amitai Etzioni, *Eight Nails into Katz's Coffin*, 65 CASE. W. L. REV. 413, 414-19 (2014) ("It is difficult to comprehend why the well-established observation that *Katz* is tautological is not itself sufficient to lay *Katz* to rest.").

Chemerinsky,²³ David Sklansky,²⁴ and Paul Schwartz,²⁵ among many

²⁰ Orin S. Kerr, *The Fourth Amendment in Cyberspace: Can Encryption Create a “Reasonable Expectation of Privacy?”* 33 CONN. L. REV. 503, 512-13 (2001) (“By linking Fourth Amendment protection to the presence of extraconstitutional rights, the rights-based conception ensures that the government cannot use its mere ability to invade privacy [as in the *Smith v. Maryland* hypothetical] as a basis for eradicating Fourth Amendment protection.”). In subsequent scholarship, Kerr astutely noted that popular expectations cannot be completely determined by their response to government practices and court pronouncements. See Kerr, *supra* note 15, at 511 n.34. Kerr described the degree of attitudinal circularity as “modest.” *Id.*

²¹ Jed Rubenfeld, *The End of Privacy*, 61 STAN. L. REV. 101, 132-33 (2008) ([T]he circularity problem ... afflicts expectations-of-privacy analysis. An announcement that all telephone calls will henceforth be monitored deprives people of their reasonable expectations of privacy in such calls.”).

²² Daniel Solove, *Fourth Amendment Pragmatism*, 51 B.C. L. REV. 1511, 1523–24 (2010) (“Second, expectations of privacy depend in part on the law, so judicial decisions about reasonable expectations of privacy would have a bootstrapping effect. If the Supreme Court said there was or was not a reasonable expectation of privacy in something, then that pronouncement would affect people’s future expectations.”).

²³ Erwin Chemerinsky, *Rediscovering Brandeis’s Right to Privacy*, 45 BRANDEIS L.J. 643, 650 (2007) (“Moreover, the Fourth Amendment approach to protecting privacy based on whether there is a “reasonable expectation of privacy” also poses serious problems. The government seemingly can deny privacy just by letting people know in advance not to expect any.”).

²⁴ David Alan Sklansky, *Too Much Information: How Not to Think About Privacy and the Fourth Amendment*, 102 CAL. L. REV. 1069, 1072 n.8 (2014) (“The Court nicely illustrated the potential of the Katz test for circularity the following term when it upheld the routine collection of DNA samples from felony arrestees, reasoning in part that arrestees have reduced ‘expectations of privacy’--and citing for that proposition earlier decisions by the Court authorizing searches incident to arrest. ‘Reasonable expectations of privacy’ can be defined by social norms rather than legal rules, but the Katz test runs into a different kind of circularity: the tendency over time for people to become accustomed to governmental violations of privacy.”) (citations omitted).

²⁵ Paul M. Schwartz, *Privacy and Participation: Personal Information and Public Sector Regulation in the United States*, 80 IOWA L. REV. 553, 573 (1995) (“[T]he Supreme Court’s search for reasonable expectations of privacy is tautological. The Fourth Amendment is held to be applicable in those circumstances in which people reasonably expect it to be applicable. Thus, when a desire for privacy is incommensurate with the general social view of reasonable privacy (or, more accurately, the Supreme Court’s estimation of this view), Fourth Amendment protection does not exist. This amendment applies only when society already

others.²⁶ Now not all of these scholars are concerned about circularity to the same degree. Some are fairly skeptical, though even they feel they cannot rule out the circularity problem entirely.²⁷

At this point it is worth introducing a distinction between two possible versions of the attitudinal circularity hypothesis. The strong version states that a well-publicized Supreme Court decision (or unchallenged action by Congress or the Executive) will have the effect of swiftly changing privacy expectations. People will hear of the decision, word will spread through their social networks, and expectations will adjust accordingly. In contrast, the weak version of circularity instead states that such governmental actions will have the effect of changing privacy expectations only over a long period of time, perhaps decades, as the change in law filters down through police and popular culture.²⁸ Put another way, the strong version circularity

awaits it.”). Schwartz goes on to emphasize feedback between technological development and popular expectations, a point later echoed by Paul Ohm. *See infra* note 26.

²⁶ *See also* Ronald J. Bacigal, *Some Observations and Proposals on the Nature of the Fourth Amendment*, 46 GEO. WASH. L. REV. 529, 536 (1977-1978) (“[T]he major inadequacy of exclusive reliance on the reasonably prudent man standard is that the standard merely reflects existing conditions without considering their desirability. The government can unilaterally change existing conditions and thus the expectations of reasonably prudent men.”); Jim Harper, *Reforming Fourth Amendment Privacy Doctrine*, 57 AM. U. L. REV. 1381, 1392 (2007-2008) (“[The reasonable expectation test’s] circularity is especially problematic here at the onset of the Information Age If proponents of government surveillance can mold expectations to their advantage, they can have broad access to communications.”). Paul Ohm articulates a variation on the traditional attitudinal circularity account. Paul Ohm, *The Fourth Amendment in a World Without Privacy*, 81 MISS. L.J. 1309, 1310-26 (2012) (“[T]he punch line is both easy to state and preordained almost to the point of being tautological--in a world without privacy, a Fourth Amendment built around reasonable expectations of privacy will no longer apply.”). Ohm emphasizes how popular expectations change in response to the use of new technologies more than case law developments, though which technologies get adopted is in part dependent on court rulings.

²⁷ Michael Abramowicz, *Constitutional Circularity*, 49 UCLA L. REV. 1, 60-62 (2001); Mary I. Coombs, *Shared Privacy and the Fourth Amendment, or the Rights of Relationships*, 75 CAL. L. REV. 1593, 1596 (1987)

²⁸ *See, e.g.*, *Dickerson v. United States*, 530 U.S. 428, 443 (2000) (“We do not think there is such justification for overruling *Miranda*. *Miranda* has become embedded in routine police practice to the point where the warnings have become part of our national culture.”).

involves people watching CNN, Fox, and *The Daily Show* and the weak version involves people watching *Law and Order*.

Most scholars discussing the circularity hypothesis are not clear which version they are endorsing, and we do not want to put words in their mouths. But many of them have used the circularity critique to either suggest that the *Katz* test is incoherent,²⁹ or to specifically criticize the incorporation of public expectations in *Katz*.³⁰ Scholars such as Christopher Slobogin, Christine Scott-Hayward, and the two of us,³¹ have argued that the courts should regularly examine reliable survey evidence to determine whether a reasonable expectation of privacy exists under *Katz*.³² If ordinary people's expectations of privacy are determined mainly by what courts or the executive say the law is, or are basically indeterminate,³³ then the social science survey approach has little to recommend it. In our view, public expectations should work as a corrective to outdated or obscure precedents and out of touch judges. If popular attitudes instead largely reflect the most recent actions of those same judges, looking to expectations gains society nothing while further muddling an already confused area of law.

But circularity is only an effective critique of our position if one adopts a strong, or at least stronger, conception of it. If one assumes that public expectations only adapt over the span of decades, then there is no difficulty in running surveys to assess public attitudes; the attitudes would still be "real" and not the immediate product of the government action. It is only if the attitudes change quickly that the survey researchers would find the ground shifting under their feet.

Testing the attitudinal circularity hypothesis therefore becomes an

urgent project for the first principles of Fourth Amendment law. If ordinary peoples' actual expectations of privacy are relatively stable and don't depend on government pronouncements, then privileging those attitudes through doctrine may well be desirable. The case for turning to social expectations in Fourth Amendment law would look a lot like the case for examining social norms when trying to determine the content of property law³⁴ or deferring to trade usages in contract litigation.³⁵ Widespread shared beliefs probably (though not inevitably) reflect accumulated societal wisdom.³⁶ And the more stable ordinary peoples' expectations of privacy are, the more predictive and stable social science studies conducted at one point in time will be at a later date.³⁷ Conversely, the more unstable, reactive, and random public attitudes are, the more reason to favor alternative theories that define the proper scope of the Fourth Amendment without any reference to popular expectations.³⁸ Answering the empirical question of whether attitudes are circular then has a major impact on the normative question of whether we should (or even can) look to such attitudes when formulating doctrine.

We therefore consider what actually happens when the Supreme Court issues a new decision on the scope of Fourth Amendment protection. When a particular decision is not widely-known, logically it is unlikely to immediately change society's expectations of privacy.³⁹ However some decisions receive widespread media coverage, and knowledge of a little-known decision's content conceivably could permeate the population over time. The extent to which this actually happens in Fourth Amendment cases is unclear. It is possible that these cases are just a flash in the pan, known to some people for an instant and then immediately forgotten, with only

lawyers and law students remembering that they ever happened. It is also possible that they instead have long-term ripples that alter societal beliefs through news coverage, mass-media content, interactions with law enforcement, word-of-mouth, social media, and subtler mechanisms.

C. Social Sciences on Attitudinal Responses to Supreme Court Decisions

Although a great deal of legal scholarship takes the notion of attitudinal circularity for granted, one of our frustrations in confronting the existing literature has been that it all ignores a large body of related political science research. For decades political scientists have been studying precisely how the public responds to major Supreme Court decisions. Yet legal scholars, as far as we know, haven't previously made any connection between this literature and circularity.

In reviewing the political science literature, it is helpful to consider the various (somewhat conflicting) findings through the lens of the psychological literature on persuasion. Two general theories are relevant here. The first is called motivated cognition. Imagine two people who strongly disagree about an issue, perhaps the death penalty. If pressed, these people would likely describe their views on the death penalty as stemming from different factual assumptions about how potential criminals respond to the existence of capital punishment, the number of mistaken convictions, the overall crime rate, and a variety of other questions. One might optimistically think that the level of disagreement would decline as these two people were exposed to new studies on the efficacy of capital punishment. Persuasion would not be total – no one gives up *that* easily – but the two sides should come closer together. This, sadly, does not happen. A classic study by Lord, Ross, and Lepper found that those exposed to information supporting their position become more extreme in their support while those exposed to information opposed to their position question the new data, moving far less than did those whose views were reinforced.⁴⁰ The overall level of polarization actually increased due to this biased assimilation of information.

Similar motivated cognition effects have been found time and time again, as people are shown to shape their assimilation and processing of new information to minimize the tension between it and their existing

⁴⁰ Charles G. Lord, Lee Ross & Mark Lepper, *Biased Assimilation and Attitude Polarization: The Effects of Prior Theories on Subsequently Considered Evidence*, 37 J. PERS. SOC. PSYCHOL. 2098 (1979).

beliefs.⁴¹ This biased processing has been shown in interpretations of information in a number of contexts, including video evidence.⁴² The relevance of motivated cognition to public reactions is quite straightforward: as in other contexts, we should expect people confronted by court decisions that run counter to their prior preferences and beliefs to resist those decisions rather than be immediately persuaded by them.

The second relevant theory is the Elaboration Likelihood Model of persuasion (ELM). This model posits that the impact of a persuasive message will vary depending on the extent to which listeners are willing and able to process the message in depth. Listeners who are not motivated to think deeply about an issue will respond to “peripheral” characteristics – a liked or attractive source, for instance – whereas those who are motivated to think deeply about the issue will respond based more on “central” characteristics, such as the quality of the argument.⁴³ Those who are motivated enough to attend to central characteristics often discount peripheral cues, meaning that the value of, say, a celebrity endorsement would be sharply limited to a highly attentive audience. Persuasion via the central route is more likely to lead to long-term attitude change whereas persuasion via the peripheral route is as superficial as the name suggests; it is short term and not especially predictive of behavior.⁴⁴

⁴¹ Ziva Kunda, *The Case for Motivated Reasoning*, 108 PSYCHOLOGICAL BULL. 480 (1990). Leon Festinger, Henry W. Riecken, & Stanley Schachter, *WHEN PROPHECY FAILS: A SOCIAL AND PSYCHOLOGICAL STUDY OF A MODERN GROUP THAT PREDICTED THE DESTRUCTION OF THE WORLD* (1956).

⁴² Albert H. Hastorf & Hadley Cantril, *They Saw a Game: A Case Study*, 49 J. ABNORMAL SOC. PSYCHOL. 129 (1954); Dan M. Kahan et al., “*They Saw a Protest*”: *Cognitive Illiberalism and the Speech-Conduct Distinction*, 64 STAN. L. REV. 851, 853 (2012) (replicating the effect in the context of video evidence).

⁴³ Richard E. Petty & John T. Cacioppo, *The Elaboration Likelihood Model of Persuasion*, in 19 ADVANCES IN EXPERIMENTAL SOCIAL PSYCHOLOGY 123 (Leonard Berkowitz ed., 1986); Richard E. Petty & Daniel T. Wegener, *The Elaboration Likelihood Model: Current Status and Controversies*, in DUAL PROCESS THEORIES IN SOCIAL PSYCHOLOGY 41 (Shelly Chaiken & Yacov Trope eds., 1999).

⁴⁴ Richard E. Petty & John T. Cacioppo, *COMMUNICATION AND PERSUASION: CENTRAL AND PERIPHERAL ROUTES TO ATTITUDE CHANGE*, 21 (1986) (“Attitude changes that result mostly from processing issue-relevant arguments (central route) will show greater temporal persistence, greater prediction of behavior, and greater resistance to counter persuasion than attitude changes that result mostly from peripheral cues”).

One of the better predictors of the level of effort that a listener will put into processing a message is their degree of personal involvement and the strength of their initial attitude.⁴⁵ Those who have a personal connection to an issue will attend to the message more. However, as suggested by the literature on motivated cognition, this will not necessarily lead to more *accurate* processing.⁴⁶ Listeners could easily spend that additional processing power trying to counterargue against the persuasive message.

Let's keep these psychological principles in mind as we consider the political science literature. The modern era of political science investigations into the relationship between Supreme Court decisions and public opinion began with an empirical study by Robert Dahl, a giant figure in American political science.⁴⁷ Dahl wrote in 1957 that although Congress usually got its way eventually in cases where the Supreme Court invalidated legislation, there were some cases where the Supreme Court had thwarted the will of Congress, either through lasting invalidation or substantial delay.⁴⁸ In such cases, Dahl wrote that the Court had prevailed because it was an important agent of political leadership in the United States and had a basis for power – “the unique legitimacy attributed to its interpretations of the Constitution.”⁴⁹ Particularly where different branches of government were in conflict with one another and where it was adopting a solution that comported with “explicit or implicit norms held by the political leadership,” the Supreme Court could make national policy.⁵⁰ This hypothesized persuasion is based on approval of the source, which is generally viewed as a peripheral cue in ELM terms.

Dahl's study used an analysis of governmental action to develop his

⁴⁵ Richard E. Petty & John T. Cacioppo, & Rachel Goldman, *Personal Involvement as a Determinant of Argument-Based Persuasion*, 41 J. PERS. SOC. PSYCHOL. 847–55 (1981) (showing that personal relevance increases attention to message quality and decreases the importance of peripheral cues).

⁵⁰ *Id.* at 294.

thesis but did not examine public opinion polling. Subsequent scholars set out to test his idea that the Supreme Court could influence national policy via what he called its “unique legitimacy.” Some of these scholars identified data that supported Dahl’s legitimacy theory. For example, Hanley, Salamone, and Wright found that the Supreme Court’s decision in *Roe v. Wade* increased public support for abortion rights, at least in the short run.⁵¹ An ingenious research paper by Katerina Linos and Kimberly Twist studied the effect of media coverage of Supreme Court decisions dealing with health care and immigration on popular opinion. They found that when respondents had been exposed (via television, radio, print reporting, and the like) to one-sided coverage of a salient decision that was supportive of what the Court had done, respondents’ views moved in a strongly pro-Court direction. This effect largely disappeared when individuals were exposed to more balanced coverage of the new decision that described its pros and cons, however.⁵² An impressive book by Valerie Hoekstra provided a more mixed picture. Hoekstra studied the localized public response in four communities where disputes that made their way to the Supreme Court arose.⁵³ She found that the disputes garnered a lot of local press attention, and in two of the four cases there was a discernible if small shift in local sentiment towards the Court’s position after a Supreme Court decision.⁵⁴ But in the other two cases she studied, no such shift occurred.⁵⁵

As the political science research continued, many empirically oriented scholars collected data that did not match Dahl’s legitimacy thesis. Rather, what political scientists were finding in many cases was that after a major Supreme Court decision, some population groups fell in line with the Court’s decision and others strongly resisted it, consistent with a motivated cognition response. This data helped give rise to the structural response model, first articulated by Charles Franklin and Liane Kosaki.⁵⁶ According

to Franklin and Kosaki, salient Supreme Court cases are likely to persuade some groups of voters and spark a backlash among others. Where one observed no change in public sentiment after a major Supreme Court decision, it is possible that the decision itself and media reports about it didn't change minds. But it is also possible that the decision changed a lot of minds, though the people who were pushed into support or opposition roughly cancelled each other out.⁵⁷ Under this account, the public sentiment on a germane issue could become more polarized after a major Supreme Court decision than it was beforehand, again consistent with a motivated cognition response.⁵⁸ Studies of popular reactions to decisions concerning homosexual sodomy seemed to have polarized opinion in this way. Both *Bowers v. Hardwick*⁵⁹ (which upheld a criminal prohibition on sodomy) and *Lawrence v. Texas*⁶⁰ (which struck it down) sparked a significant decline in popular support for same-sex relationships.⁶¹

To be sure, support for same-sex relationships has risen very dramatically since *Bowers*, but each judicial opinion sparked a discernible negative reaction in popular sentiment, such that it took several years after *Lawrence* was decided for popular support for same sex relationships to reach the approval levels it garnered just before the decision.⁶² Indeed, Gallup polling data reveal that there have been only two periods since 1979 in which a plurality of Americans said that "homosexual relations between consenting adults should not be legal": 1986 to 1989 (right after *Bowers*) and 2003 (right after *Lawrence*).⁶³ Demographic characteristics strongly predicted whether Americans were likely to rally around gay rights or reject them after the decisions.⁶⁴ More recent work supports their findings, producing evidence of partisan polarization in the response to *Burwell v.*

⁵⁷ *Id.* at 753-54, 767-68.

⁵⁸ Interestingly, the response to *Roe* loomed large for Franklin and Kosaki as well, even though they took very different implications from it than Hanley, Salamone, and Wright. Compare *supra* text accompanying note 51.

Hobby Lobby,⁶⁵ a 2014 Supreme Court decision.⁶⁶ Follow-up work on the structural model produced more confounding findings, with mixed results concerning how the public responds when the Court issues several decisions about the same topic.⁶⁷

Finally, in recent years a new model has emerged to describe the popular reaction to prominent Supreme Court decisions. Joseph Ura's thermostatic model posits that when the Supreme Court makes increasingly liberal decisions the populace will embrace decreasingly liberal policy views, and vice versa.⁶⁸ The thermostatic model regards the American populace as interested in stability in the short run, such that they will pull back against decisions that seem to alter the status quo. Over the long run, though, the thermostatic model posits that the kind of legitimization effect that Dahl hypothesized does seem to occur. Ura describes his data as indicating "a complex interaction between the Supreme Court and the mass public characterized by short-term backlash against Supreme Court decisions in public mood followed by a long-run movement in public opinion toward the ideological position taken up by the Court."⁶⁹ Notably, the thermostatic model focuses on the aggregate effects of all the Supreme Court's salient / high-profile decisions in a particular Term, rather than trying to isolate the effects of a single Supreme Court decision concerning abortion, the Second Amendment, the death penalty, or election law.⁷⁰

Having surveyed this rich literature, let's examine what it might tell us – and what it might not tell us – about attitudinal circularity with regard to

⁶⁵ 134 S. Ct. 2751 (2014).

⁶⁶ Aziz Z. Huq & Avital Mentovich, *The Polarizing Court* (2015 unpublished manuscript).

⁶⁷ In cases where the Supreme Court rendered several decisions about a topic (as with abortion or the death penalty), some evidence suggests that only the Supreme Court's first major decision on a topic seemed to generate a discernible impact on popular opinion. See Timothy R. Johnson & Andrew D. Martin, *The Public's Conditional Response to Supreme Court Decisions*, 92 AM. POL. SCI. REV. 299, 306 (1998). But other research examining the abortion data through a different lens failed to replicate that finding. Danette Brickman & David A.M. Peterson, *Public Opinion Reaction to Repeated Events: Citizen Response to Multiple Supreme Court Abortion Decisions*, 28 POL. BEHAV. 87 (2006).

⁶⁸ Joseph Daniel Ura, *Backlash and Legitimation: Macro Political Responses to Supreme Court Decisions*, 58 AM. J. POL. SCI. 110, 111-13 (2014).

⁶⁹ *Id.* at 118.

⁷⁰ *Id.* at 120.

the *Katz* test. First, the idea that the public will fall into line with the Supreme Court's pronouncements about search and seizure law seems unlikely. In many of the political science papers, there was zero net impact on public attitudes, and in some cases the effect was actually negative. Also, most Fourth Amendment decisions are not particularly salient. They do not receive significant media coverage and, as a result, the overwhelming majority of citizens do not know they happened.⁷¹ As scholars in this area are quick to point out, the public knows little about what the Court does.⁷² It might strike a reader as surprising to think that the Court would have *no* effect as often as not: should it not matter that a relatively liked institution has endorsed a particular position? Well, yes, it should. But only if the public is aware of the endorsement *and* not so attentive to the issue to ignore the peripheral cue in favor of attention to the issue's merits. And when persuasion occurs in that sweet spot of shallow processing it is likely to be particularly fragile.

Second, even when a highly significant Supreme Court criminal procedure decision (like *Katz*, *Miranda*, or *Jones*) is announced, we should not be so quick to assume that the public will be persuaded by the Court's moral judgment. That could happen under a legitimacy theory, and it could happen in the long run under the thermostat theory. But the structural response model suggests that the public will become more polarized after the Court's intervention, and will not collectively follow it. And here motivated cognition, which indicates that those opposed to a Court decision will counterargue against it, and the ELM, which posits that source characteristics are generally peripheral cues and unlikely to persuade those who are thinking deeply about an issue, both support the skepticism of the structural model. Finally, consistent with the thermostat model we might expect to see a short run backlash against the Court's judgment, suggesting the *opposite* of attitudinal circularity in the Fourth Amendment context.

The collection of mixed effects just reviewed doesn't even address the question of how well insights drawn from outside the Fourth Amendment will translate to the search and seizure context. Might some of the heterogeneity just reviewed be a function of the different issues studied, which ranged from abortion, to capital punishment, to gay rights, to purely local issues? It seems possible.

⁷¹ This phenomenon of citizen ignorance about important developments in government is hardly unique to the work of courts. *See generally* ILYA SOMIN, *DEMOCRACY AND POLITICAL IGNORANCE* (2d ed. 2016).

⁷² *See, e.g.,* HOEKSTRA, *supra* note 53, at 112-14.

In short, given the widespread belief in attitudinal circularity among Supreme Court justices and leading Fourth Amendment scholars, and given the political science literature that suggests some reasons to doubt the consensus in elite legal circles, there is an urgent need for empirical work to examine how the public updates its beliefs about the state of search and seizure law in response to a major change in the content of the law. We will describe our effort to fill that gap in Parts II and III. Our main goals for the study were threefold: to expand on the existing literature by measuring the impact of a Fourth Amendment decision, which had not previously been done, to track both the immediate and long-term effects of the decision, and to assess a range of privacy attitudes so we could determine exactly how public expectations shifted in the wake of the decision.

II.) RILEY V. CALIFORNIA

Assessing attitudinal circularity requires information about privacy expectations before and after a major Supreme Court decision on the scope of the Fourth Amendment. Such decisions are uncommon, and major polling organizations do not regularly poll on privacy expectations, let alone poll with the level of specificity needed to measure the impact of a particular case.⁷³ A golden opportunity to test the attitudinal circularity hypothesis arose in early 2012, when the Supreme Court *United States v. Jones*.⁷⁴ That surprising and widely publicized decision substantially altered Fourth Amendment law, suggesting that the Constitution might protect information about a vehicle's movements from one public place to another. But nobody thought to use precise polling to obtain a before and after snapshot of public attitudes on GPS tracking. Even if scholars had tried, the timing of the *Jones* decision was so unpredictable⁷⁵ that there was a significant danger that the pre-*Jones* polling might occur several months before the Court's decision, increasing the chances that some extrinsic factor explained any observed shifts in attitudes. We conceptualized the present project by bemoaning the missed opportunity in *Jones* and wondering whether lightning might strike a second time.

The following year we realized there might be precisely such an opportunity in *Riley v. California*.⁷⁶ Two consolidated Fourth Amendment

⁷³ See, e.g., Valerie J. Hoekstra & Jeffrey A. Segal, *The Shepherding of Local Public Opinion: The Supreme Court and Lamb's Chapel*, 58 J. OF POL., 1079, 1083–84 (1996).

⁷⁴ 565 U.S. 400 (2012).

⁷⁵ The case was argued in early November and handed down in late January.

⁷⁶ 134 S. Ct. 2473, 2481 (2014).

cases concerning police searches of cell phones were calendared for the last week of oral argument in the Supreme Court's 2013 Term. And cases argued at the end of the Term are usually handed down at the end of the Term, so we could time our polling with much more precision than usual. We did not expect that *Riley* would be nearly as big of a deal as it turned out to be, but there was a chance of something major happening in Fourth Amendment law so we figured paying for two nationally representative samples was a worthwhile gamble.

David Riley's case involved the recovery of pictures from his smart phone, and the consolidated case of Brima Wurie involved the recovery of an address from a flip phone's contact list. Existing case law had been read to allow warrantless searches of physical containers in the arrestees' possession, like purses, wallets, and briefcases, incident to arrest.⁷⁷ So an arrested person could expect a warrantless search of any personal papers they were carrying, including address books and the like. A literal-minded application of precedent would have applied the same rule to cell phones: why should it matter whether the seized address book was physical or electronic? As Judge Posner observed not long before *Riley*, "[i]t's not even clear that we need a rule of law specific to cell phones or other computers. If police are entitled to open a pocket diary to copy the owner's address, they should be entitled to turn on a cell phone to learn its number."⁷⁸ Before *Riley*, the federal appellate courts frequently upheld warrantless searches of cell phones incident to arrest.⁷⁹ Writing on SCOTUSBlog before oral argument, Lyle Denniston anticipated that the Court would be "cautious" perhaps deciding "these cases narrowly," in a manner that treated smart phones and flip phones differently.⁸⁰ A few days later, summarizing oral

⁷⁷ See *United States v. Robinson*, 414 U.S. 218 (1973) (contents of a cigarette pack); *United States v. Carrion*, 809 F.2d 1120, 1123, 1128 (5th Cir. 1987) (billfold and address book); *United States v. Watson*, 669 F.2d 1374, 1383–1384 (11th Cir. 1982) (wallet); *United States v. Lee*, 501 F.2d 890, 892 (D.C. Cir. 1974) (purse).

⁷⁸ *United States v. Flores-Lopez*, 670 F.3d 803, 807 (7th Cir. 2012).

⁷⁹ See, e.g., *United States v. Curtis*, 635 F.3d 704, 711-13 (5th Cir. 2011); *United States v. Finley*, 477 F.3d 250, 259-60 (5th Cir. 2007); *United States v. Murphy*, 552 F.3d 405, 411-12 (4th Cir. 2009); see also *Flores-Lopez*, 670 F.3d at 809-10 (permitting a limited cell phone search incident to arrest, while reserving the question of whether a more invasive search would have been permissible without a warrant).

⁸⁰ Lyle Denniston, *Argument Preview: Police and Cell Phone Privacy*, SCOTUSBlog, April 25, 2014, available at <http://www.scotusblog.com/2014/04/argument-preview-police-and-cellphone-privacy/> (visited Dec. 14, 2016).

arguments in the two cases, Denniston seemed certain of little except his “strong impression that the Justices would stay away from flat rules: either that police can always search any such device that they take from an arrested person, or that they could not search its contents at all.”⁸¹ We think the average citizen knew essentially nothing about the cases before they were decided, and the lawyers that were following them do not appear to have expected a sea change in the law.

Despite these modest expectations, *Riley* charted a new course. The Court likened the argument that cell phones were “materially indistinguishable” from briefcases to “saying a ride on horseback is materially indistinguishable from a flight to the moon. Both are ways of getting from point A to point B, but little else justifies lumping them together.”⁸² Cell phones simply contain too much information to treat them like physical papers. So the Court fashioned a bright line rule, albeit with a caveat that police could dispense with the need for a warrant in standard-ish “exigent circumstances.” As the Chief Justice concluded his opinion: “Our answer to the question of what police must do before searching a cell phone seized incident to an arrest is accordingly simple—get a warrant.”⁸³

Most surprisingly, the Court’s ruling against the government was unanimous,⁸⁴ and Chief Justice Roberts’ decision received prominent and generally celebratory media coverage in the days following the ruling. Political scientists observe that the existence of dissents in prominent Supreme Court cases tends to draw significant media attention, resulting in an increased likelihood of a polarized public response to a ruling by the Court.⁸⁵ But when the public reads one-sided, positive coverage of an opinion, they are likely to be persuaded by what the Court had done.⁸⁶ So

⁸¹ Lyle Denniston, *Argument Analysis: Limiting a Search? Sure, But How?*, SCOTUSBlog, April 29, 2014, available at <http://www.scotusblog.com/2014/04/argument-analysis-limiting-a-search-sure-but-how/> (visited Dec. 14, 2016).

⁸⁵ Stoutenborough et al., *supra* note 61, at 425.

⁸⁶ See *supra* text accompanying note 52.

the unanimity of *Riley* amplified the “treatment dosage” in terms of judicial influence on public beliefs.

Riley figured prominently in the nightly news broadcast for the major networks on the evening of the decision, with NBC and CBS making it their lead story and ABC discussing it as their second story of the night.⁸⁷ Stories about *Riley* were front page news in most of the nation’s largest circulation newspapers as well,⁸⁸ another factor that political scientists view as meaningful in determining whether a case can be described as sufficiently salient to capture public attention.⁸⁹ The *Los Angeles Times* called *Riley* the Supreme Court’s “most sweeping and surprising criminal-law opinion in years.”⁹⁰ The *Washington Post* emphasized the surprising nature of the decision, especially given the uncertainty apparent when the case was argued: “During oral arguments, the justices seemed divided over the issue. But they united behind soaring language from Roberts about privacy

⁸⁷ See Transcript, ABC World News with Diane Sawyer, June 25, 2014, available at 2014 WLNR 17743541 (*Riley* was the second story reported, with the Court calling it a “landmark ruling” and a commentator calling it “probably the most important privacy ruling in the digital age”); Transcript, CBS Evening News, June 25, 2014, available at 2014 WLNR 17458527 (*Riley* was the first story reported, with anchor Scott Pelley noting that “the Supreme Court justices spoke with one voice today,” and CBS News Correspondent Jan Crawford calling it “a major victory for privacy rights in the modern digital era”); Transcript, NBC Nightly News, June 25, 2014, available at 2014 WLNR 17465369 (*Riley* was the first story reported, with anchor Brian Williams calling it “a big victory for personal privacy” and commentator Tom Goldstein saying, “It was almost a shock, the breadth with which the justices were willing to protect private information that’s on computers and cell phones on the internet.”).

concerns in the digital era...”⁹¹ The *New York Times* described the case as a “sweeping victory for privacy rights in the digital age,” and prominently quoted Orin Kerr’s assessment that the Court had thrust the Fourth Amendment into “a new digital age. You can’t apply the old rules anymore.”⁹² The *Wall Street Journal* called *Riley* “a watershed, showing that all nine justices are keen to re-examine categorical rules written for an earlier era.”⁹³

Riley therefore represented an unambiguous change in law.⁹⁴ As Kerr observed immediately in the wake of the decision “*Riley* can be fairly read as saying that computers are a game-changer.”⁹⁵ This conclusion had implications for a variety of parts of Fourth Amendment law, ranging from warrant specificity, to searches at the national border, to long-term electronic monitoring in public places.⁹⁶ Paul Ohm described *Riley* as a “significant milestone in constitutional criminal procedure,” and a “privacy opinion for the ages.”⁹⁷ He added that “*Riley v. California* is not the only recent pronouncement from the Supreme Court embracing a new vision of the Fourth Amendment in a technological age, but it is the most important.”⁹⁸ Whatever the merits of the *Riley* opinion, from a social

⁹⁴ Courts in recent years have held that evidence gathered from pre-*Riley* searches of cell phones incident to arrest admissible under the Fourth Amendment’s good faith exception, meaning that before *Riley* officers were well within their rights to believe they had the authority to search a cell phone incident to an arrest. *See, e.g.*, *United States v. Gary*, 790 F.3d 704, 708-10 (7th Cir. 2015); *United States v. Eccleston*, 615 Fed. Appx. 767 (4th Cir. 2015).

science perspective its unanimity, clarity, and the media's reaction to it made it a nearly ideal vehicle for studying the public response to Supreme Court decisions. As evidently the only empirical researchers studying the effects of *Riley* on popular beliefs in real time, we had gotten a very lucky break.

III.) AN EMPIRICAL TEST OF CIRCULARITY

Because *Riley* was argued so late in the term, it was possible to approximate when the decision would issue with relatively high certainty. This allowed us to schedule the first two waves of our four-wave survey to closely bracket the decision. The first wave was administered June 11 – 13, 2014, and *Riley* was handed down on June 25, 2014. Wave II was administered July 1 – 2, 2014, one week after the decision, to measure its immediate impact. To measure the longer-term effect, we conducted Wave III a year after that, May 26 – June 2, 2015, and Wave IV a year after that, July 21 – August 4, 2016.

For each wave, a weighted sample of adult American citizens was recruited by Toluna, a professional survey firm with an established panel. The exact demographics of each wave are reported in the Appendix. Though there are some other minor variations in representation across waves, there were no substantial shifts on age, sex, race, or ethnicity, and all were controlled for in the main analysis.

A. *Main Dependent Measure*

Since the *Riley* decision changed the treatment of cell phone searches incident to arrest, the primary study measure assessed privacy expectations in that context. Participants were randomly assigned to imagine that a person was being arrested for either possession of cocaine or attempted murder. We used the two different crimes so that we could be more confident that our results were not idiosyncratic to crime type. As discussed below, crime type had no impact on our change over time story.

Participants were asked two types of questions about a variety of possible searches, each question intended to tap a slightly different perspective. One asked “[w]ould the arrestee (i.e., the person being arrested) reasonably expect that police will [conduct a particular search]?” and the other asked “[u]nder the Constitution, can the police do this to the arrestee without first getting a search warrant?” The first question was answered on 5 point scales ranging from “Definitely Not” to “Definitely Yes.” The “reasonably expect” question places greater emphasis on what is likely to happen, while the “warrant” question instead emphasizes what the participant believes the Constitution requires. As part of a previous project, we experimented with a variety of different ways of asking about

expectations of privacy. For example, we asked whether a search violated people “privacy,” “expectations of privacy,” or “reasonable expectations of privacy,” as well as altering whether the question asked about “people’s” privacy or “your” privacy.⁹⁹ Though using a first-person framing produced slightly higher privacy expectations overall, we found no other differences. Here we opted for a third person framing because we thought it odd to ask participants to imagine themselves being arrested for attempted murder.

The searches the participants were asked to consider were split into eight physical searches and eight cellphone searches. The particular searches were selected to represent a range of intrusiveness to allow for variance in responses. The physical searches included items such as “search his car for any packages he might be carrying and open the packages” and “perform a body cavity search.” The electronic searches included “search the phone for a list of most recent calls” and “use the phone to open his Facebook app and read his newsfeed and messages.” The text for all searches is included in the Appendix. Since the change in law was specific to cell phones and cell phone searches were explicitly differentiated from physical searches, the physical search questions served as a control.

To simplify the analysis, composite variables were created for both the physical and electronic searches by averaging the responses to each of the eight scenarios. As a result there were composite “expectation” scores, which ranged from 1 to 5 with higher numbers indicating a greater expectation of privacy, and composite “warrant” scores, which ranged from 0 to 1 and indicated the percentage of the eight scenarios for which warrants were believed to be required.¹⁰⁰ Greater “expectations of privacy” are therefore indicated by higher “expectation” scores and higher “warrant” scores.

An ANCOVA¹⁰¹ was conducted on these measures that controlled for a variety of demographic variables to account for the minor cross-sample variations, and we treated participant wave and attributed crime condition

⁹⁹ Kugler & Strahilevitz, *supra* note 4, at 248 n 170.

¹⁰⁰ All four composites were highly reliable. Expectation-Electronic $\alpha = .96$, Warrant-Electronic $\alpha = .95$, Expectation-Physical $\alpha = .85$, Warrant-Physical $\alpha = .80$. In the survey itself, higher scores on the expectation measure indicated greater expectation of *searches*, but the coding was flipped for analysis to ease interpretation.

¹⁰¹ Analysis of Covariance. This compares means across conditions while controlling for (holding constant) other factors as in regression. Given the same inputs, an ANCOVA and a multiple regression are statistically interchangeable.

(cocaine or attempted murder) as independent factors.¹⁰² Though there were main effects of attributed crime on the electronic and physical expectation measures, this factor did not have a significant effect on the warrant measure and did not interact significantly with wave for either measure.¹⁰³ More importantly, there were significant differences across waves on both of the electronic search dependent measures (expectation and warrant). As shown in Table 1, both of the measures shifted in a pro-privacy direction between Waves I (two weeks before) and II (one week after) and then shifted back to baseline for Wave III (one year after) and IV (two years after). The two physical search dependent measures did not differ significantly across waves.¹⁰⁴

¹⁰² Specifically, the ANCOVA controlled for sex, age, Black or SE Asian race, Hispanic ethnicity, and educational attainment. These were selected ex ante but the results were robust to a variety of possible other arrangements, including raw (unadjusted) means. Presented dependent variable means are estimated for the mean scores on each of the controls.

¹⁰³ There was a significant main effect on the electronic $F(1, 4112) = 44.63, p < .001$ and physical $F(1, 4112) = 31.92, p < .001$ expectation measures, but not on either warrant measure ($F_s < 1$). This may indicate that some participants were reading expectation as a matter of what police would bother to do while reading the warrant question as covering what the police were legally allowed to do. It was to deal with this type of interpretative ambiguity that we asked both questions.

¹⁰⁴ This could also have been analyzed as a mixed ANCOVA with physical versus electronic search as a within subject factor. When this analysis is conducted, there is a significant interaction between search type and wave, supporting the story presented here.

Table 1: Adjusted means on primary dependent measures

		Wave I: Premeasure N = 700	Wave II: One Week N = 751	Wave III: One Year N = 1399	Wave IV: Two Years N = 1294	df	F	η^2	N ¹⁰⁵
Electronic Search	Expectation	2.79 _a (.05)	3.00 _b (.05)	2.74 _a (.04)	2.78 _a (.04)	3, 4118	5.96 ***	.004	4132

Numbers are means (std. errors in parentheses). If a measure differs significantly across condition, scores on that measure that do not share a subscript are significantly different from each other.

The difference between Waves I and II on the electronic measures somewhat supported the circularity critique: immediately in the wake of a relevant Supreme Court decision, people appear to be updating their expectations on both measures to match the new guiding law. And this is not a general change in privacy expectations but rather a change targeted to the content of the decision; expectations regarding physical searches did not change significantly. What follows Wave II undermines the circularity

¹⁰⁵ The reader might be wondering why the number of participants varies so much across question. Though the main *Riley* questions were identical across all waves, variants were introduced for some of the other questions. A large number of participants in Wave III received different versions of the GPS monitoring questions, and from Wave III on there were two variants of the “Other REP” questions, an original and an “author’s preferred” version that removed language we believed was biasing. Since the subject of interest in this Article is changes over time, only results from the versions of the questions used in Wave I were analyzed. Results from Wave III of the “author’s preferred” version are reported in Kugler & Strahilevitz, *supra* note 4, at 260.

critique, however: expectations returned to their baseline a year after the decision and they remained there the following year. The best interpretation of this data are that the effect of *Riley* on public attitudes was small – the effect sizes are quite modest – and that even this small effect is likely short-lived.

This data are displayed in Figure 1. Note that while the physical search expectation and warrant measures (the two lower lines) are flat across wave, the electronic measures (the two higher lines) both move significantly in the two-week post-decision wave and then return to their starting levels in the third wave.

Figure 1: Changes in Expectations and Perceived Warrant Requirements Across Waves.

Error bars represent 95% confidence intervals.

B. Comparison Dependent Measures

Many commentators considering the *Riley* decision speculated that it would have a major impact on other areas of Fourth Amendment law. As noted above, the general question of whether “computers are different” appears in a number of different guises, and *Riley* itself can be read as having serious implications for the mosaic theory, which, if adopted, would substantially rewrite a number of key precedents.¹⁰⁶ We therefore asked

¹⁰⁶ See generally Orin S. Kerr, *The Mosaic Theory of the Fourth Amendment*, 111 MICH. L. REV. 311, 313 (2012) (“Under the mosaic theory, searches can be

about a number of other searches to see whether expectations regarding them were impacted by the *Riley* decision. These questions were of the form used in our prior research, asking “Would it violate people's reasonable expectations of privacy if law enforcement [performed various searches]” with the possible responses ranging from 1 – Definitely Not to 5 – Definitely Yes. Again, higher numbers indicate greater expectations of privacy. The wording of the particular questions is given in the Appendix. The cross wave comparison on these questions used the same controls as the ANCOVA reported on the main measures, though it omitted the crime-type factor as it was not relevant (only the arrest questions referred to it).¹⁰⁷

If there is substantial feedback between judicial decisions and public expectations then expectations on some of these questions should also change, and the change should fit the pattern of increasing privacy expectations immediately after the *Riley* decision that persist or perhaps even strengthen over time. This is not observed on any measure. One set of these questions, discussed in our prior paper on the mosaic theory, asked about tracking a person's car on public streets using its onboard GPS system for various lengths of time (an instant, a day, a week, and a month).¹⁰⁸ The mean response to these questions did not differ significantly across waves even though this issue arguably also reduces to “quantity makes it different” and “electronic surveillance is different,” the exact issues highlighted by Justice Roberts in *Riley*. Likewise the use of data from a camera in the public park was not viewed differently across waves.

The only searches that are viewed differently across time periods are the remote activation of a laptop's webcam, the use of facial recognition technology at a public sporting event, and obtaining a person's emails from

analyzed as a collective sequence of steps rather than as individual steps. Identifying Fourth Amendment searches requires analyzing police actions over time as a collective ‘mosaic’ of surveillance; the mosaic can count as a collective Fourth Amendment search even though the individual steps taken in isolation do not.”).

¹⁰⁷ As we indicated in *supra* note 105, we changed how we asked these questions during the research program. The original wordings for some of these items described the people searched as criminal “suspects,” which has the impact of significantly deflating privacy expectations because it is more reasonable to search someone who is suspected of a crime. For consistency, Table 1 reports responses only from the participants in each wave who received the “old” versions of the questions. Responses to the “new” versions are available in our prior paper. Kugler & Strahilevitz, *supra* note 4, at 258–60.

¹⁰⁸ *Id.*

their ISP. The shifts in these attitudes, however, are in the wrong direction entirely; privacy expectations are *reduced* in Waves III and IV. Also the changes in these attitudes did not come in Wave II, as they should have if *Riley* were the cause.

One of the searches employed in Waves III and IV asked participants whether it would violate people's reasonable expectations of privacy if police:

Searched a hotel's guest register to obtain the names, home addresses, and assigned hotel room numbers of the guests who stayed there on a particular night?

This search was inspired by *Los Angeles v. Patel*,¹⁰⁹ which presented a facial challenge to a California statute requiring hotel operators to keep such records and open them to police inspection upon request. *Patel* was the only major Fourth Amendment search case decided by the Supreme Court during the 2014 Term. On June 22, 2015, the Court held 5–4 that the statute was in violation of the Fourth Amendment. Both Justice Sotomayor's majority opinion and Justice Scalia's dissent focused on the administrative search exception and whether hotels were a sufficiently regulated industry that they could be made to turn over records without having the option of precompliance review. Justice Sotomayor described the hotel operator's privacy expectations in terms of how dangerous their industry was compared to those previously labeled as closely regulated.¹¹⁰ Justice Scalia instead would have the question turn on "the expectations of those who enter such a line of work,"¹¹¹ and specifically whether hotel operators understood their business to be so regulated that book inspections were par for the course. But neither would have made the question turn on the privacy expectations of hotel *guests*.

The case was pending at the time we ran Wave III and we timed that wave so that the case would be likely to come down shortly after the wave was completed. Because public privacy expectations were not at stake in *Patel* the way they were in *Riley* and the decision as written did not emphasize them, we did not run the same kind of post-decision survey that year. Wave IV, however, can still serve as a one year out comparison. As with *Riley*, one year after the *Patel* decision privacy expectations were the same as they were on the predecision baseline; the two numbers are

¹⁰⁹ 135 S. Ct. 2443 (2015).

¹¹⁰ 135 S. Ct. at 2454 (Sotomayor).

¹¹¹ 135 S. Ct. at 2461 (Scalia, dissenting).

virtually identical (see Table 1). If there was an initial effect of the decision, it was gone by that time.

The *Patel* decision would not have been the best candidate for Fourth Amendment circularity, and we do not want to over-interpret reactions to this fairly insignificant case. The issue got much less coverage than *Riley*'s and the impact on the public's privacy was one-step removed. But to the extent that one can draw conclusions, the *Patel* pattern supports the *Riley* story: if the Supreme Court had any effect on public privacy expectations, that effect was gone within a year.

C. Knowledge of the Riley Decision

It was expected that those who had heard of the *Riley* decision and could explicitly remember it would have different reactions than those who had not and could not. Therefore at the end of the *Riley* portion of the survey, participants were asked:

On June 25, 2014, the US Supreme Court announced its decision in *Riley v. California*. The Court decided whether a warrant was required before the police could search the cell phone of someone they had just arrested. Had you heard about the Supreme Court's decision in that case prior to this survey?

As shown in Table 2, 40% of the sample in Wave II reported having heard of the decision, as did 20% in Wave III and 22% in Wave IV. These numbers seem somewhat high based on previous work on awareness of Supreme Court decisions, so there may be some false positive reports. Even major Supreme Court cases often achieve only modest fame,¹¹² though awareness is often higher in the immediate wake of decisions.¹¹³ If the 40% figure is to be believed, it would be on level with national knowledge in the wake of *Planned Parenthood v. Casey*.¹¹⁴ As we noted above, however, *Riley* was something of a Fourth Amendment superstar and received an impressive amount of media coverage, so the figure may not be as

¹¹² C-SPAN, *Landmark Cases: Which Supreme Court rulings are Americans familiar with?* (Oct. 1, 2015) (available at http://static.c-span.org/files/pressCenter/Landmark_Cases_Poll_Release_Oct_1_2015REV.pdf).

¹¹³ Valerie J. Hoekstra, *The Supreme Court and Local Public Opinion*, 94 AMER. POL. SCI. REV. 89, 92–32 (2000). Charles Franklin, Liane C. Kosaki, & Herbert Kritzer, *The Salience of United States Supreme Court Decisions*, unpublished manuscript, *16 (1993) (available at <http://users.polisci.wisc.edu/kritzer/research/opinion/spsa1992.pdf>) (noting a month long uptick in awareness).

¹¹⁴ HOKESTRA, *supra* note 53, at 73–75.

outlandish as the *Casey* comparison makes it appear.¹¹⁵ Those who had heard about *Riley* generally said they had first heard about the decision from television coverage (47.5%), with the next most frequently attributed source being internet news sites and blogs (16.7%). In any event, it is noteworthy, though not surprising, that the number of the respondents who claimed to have known about a decision declined by half within a year.

To assess the impact of this self-reported knowledge, an ANCOVA was conducted that used a variable that combined wave with whether the participant reported having heard of *Riley* as its primary predictor. The ANCOVA otherwise employed the same controls as in the main analysis. There were thus seven groups (one for Wave I and two for each of the other waves, one group reporting knowledge and the other not). There were significant differences across these groups on both of the electronic measures but on neither of the physical measures.¹¹⁶ Post hoc analyses revealed that there was a significant difference in Wave II between those who reported having heard of the *Riley* decision and those who had not. As can be seen in Table 2, those in Wave II who had heard of the *Riley* decision had significantly stronger privacy expectations than those who did not, and there was no difference between people in Wave I (who *could not* have heard of a decision that hadn't happened yet) and those in Wave II who said they *had not* heard of *Riley*. So the increase in privacy expectations observed in Wave II is being driven entirely by those who claim to have heard of the decision.

¹¹⁵ See Part II.

¹¹⁶ Electronic Expectation, $F(6, 4112) = 4.85, p < .001, \eta^2 = .007$; Electronic Warrant, $F(6, 4112) = 4.74, p < .001, \eta^2 = .007$; Physical Expectation, $F(6, 4112) = 2.06, ns, \eta^2 = .003$; Physical Warrant, $F(6, 4112) = 1.32, ns, \eta^2 = .002$.

Table 2 Adjusted means on primary dependent measures as a function of self-reported *Riley* knowledge.

Know <i>Riley</i>		Wave I: Premeasure	Wave II: One Week		Wave III: One Year		Wave IV: Two Years	
		NA	No	Yes	No	Yes	No	Yes
Electronic Search	Expectation	2.79 _{bc} (.05)	2.88 _b (.07)	3.19 _a (.08)	2.78 _{bc} (.04)	2.64 _c (.08)	2.79 _{bc} (.04)	2.75 _{bc} (.08)
	Warrant	0.66 _{bc} (.02)	0.68 _c (.02)	0.77 _a (.02)	0.67 _b (.01)	0.63 _{bc} (.02)	0.67 _{bc} (.01)	0.62 _c (.02)
Physical Search	Expectation	2.31 (.04)	2.46 (.05)	2.35 (.06)	2.37 (.03)	2.26 (.06)	2.43 (.03)	2.33 (.06)
	Warrant	0.48 (.01)	0.50 (.01)	0.49 (.02)	0.47 (.01)	0.46 (.02)	0.48 (.01)	0.45 (.02)
Percent Knowing of <i>Riley</i>		NA	40.29		21.09		22.41	

Numbers are means (std. errors in parentheses). If a measure differs significantly across condition, scores on that measure that do not share a subscript are significantly different from each other.

In Waves III and IV, there were no significant differences on these privacy measures between those who claimed to have heard of *Riley* and those who did not. The nonsignificant differences in those waves are actually in the wrong direction, with those claiming to have heard of *Riley* having *lower* privacy expectations and *less* protective beliefs about warrant requirements than others. So in addition to fewer people in Waves III and IV claiming to have heard of *Riley*, this claim seems to mean something different in those waves than it did in Wave II.

The change over time data are also depicted in Figure 2. Note here that the “Don’t Know” lines are flat across waves whereas the “Know” lines show changes in Wave II but then return to baseline in Wave III.¹¹⁷

¹¹⁷ Since participants could not know of *Riley* before the decision was issued, the overall data are used for both the “Know” and “Don’t Know” lives in Wave I.

Figure 2: Changes in Expectations and Warrant Requirements Depending on Whether the Participants Knew of *Riley*.

Error bars represent 95% confidence intervals.

Results on another measure support the interpretation that knowledge of the decision has a different meaning in the later waves. In each wave, participants were asked four questions assessing their knowledge of the Supreme Court. For example, participants were asked to identify the Chief Justice and state how many Justices currently sit on the Court.¹¹⁸ From these four questions a scale was created ranging between 0 and 1 that reflected the proportion of questions each participant had gotten correct. Scores on this measure across the later three waves were analyzed in a 3 (wave) by 2 (knowledge of *Riley*) ANOVA. Results showed a significant interaction between knowledge of *Riley* and wave.¹¹⁹ Though those claiming to know about *Riley* did better on the knowledge test in each wave, this difference was largest in the second wave, indicating that the difference in claimed knowledge had the most meaning at that time point.¹²⁰ Since

¹¹⁸ All questions given in the Appendix. Note that the number of Justices question was artificially difficult in Wave IV because the correct answer had changed following Justice Scalia's death.

¹¹⁹ $F(2, 3419) = 3.25, p < .05 \eta^2 = .002$.

¹²⁰ Wave II $F(1, 748) = 25.79, p < .001 \eta^2 = .033$, $M_{\text{know}} = .60, SD = .31$; $M_{\text{not}} = .48, SD = .33$.

those who said they knew of *Riley* objectively did know more about the Court, this gives us increased confidence that a meaningful number of participants were reporting their knowledge accurately, particularly in Wave II.

D. Informing about *Riley*

At the close of the experiment, after all the other data had been collected, we told people about the *Riley* decision's holding and then readministered the main electronic search dependent measures. The text of this disclosure is in the Appendix. Participants in Waves II through IV therefore responded to the electronic expectation and warrant questions twice: at the start of the study, before they were told of the decision, and at the close of the study, after they had been. This design was, in our view, likely to provoke a kind of demand characteristic: having just been given arguably relevant information about their privacy expectations by the survey itself, we could reasonably expect that participants would echo that information back to us.¹²¹ We thought, however, that these data could present a useful point of comparison.

A mixed ANOVA was conducted on these electronic expectation and warrant questions that employed crime type, wave, and prior knowledge of the *Riley* decision as between subject factors and the timing of the questions, whether they were before or after having been told of the *Riley* decision's holding, as a within subject factor.¹²² There were significant differences between the expectation and warrant data gathered at the start of the study and that gathered after the participants had been informed of the

Wave III $F(1, 1390) = 3.82, p = .05 \eta^2 = .003, M_{\text{know}} = .48, SD = .35; M_{\text{Not}} = .44, SD = .31.$

Wave IV $F(1, 1289) = 12.25, p < .001 \eta^2 = .009, M_{\text{know}} = .45, SD = .32; M_{\text{Not}} = .38, SD = .30.$

¹²¹ The experimental approach has been used previously by political scientists. *See, e.g.,* Patrick J. Egan & Jack Citrin, *The Limits of Judicial Persuasion, and the Fragility of Judicial Legitimacy*, 2011 Working Paper, available at <http://escholarship.org/uc/item/2gh262w3> (visited Dec. 15, 2016). *See generally* Paul Grice, *Studies in the Way of Words* (1989) (describing the general norms of conversation, such that listeners will generally assume that information they are presented with is relevant to the ongoing conversation and is informative). Austin L. Nichols & Jon K. Maner, *The Good Subject Effect: Investigating Participant Demand Characteristics*, 135 J. GEN. PSYCH. 151-165 (2008).

¹²² The usual effects of wave, crime type, and the interaction between wave and prior knowledge of *Riley* were again observed, but they were simply as reported before.

Riley decision; having been told of the decision, participants expected more privacy on both measures.¹²³ See Table 3 for means. This main effect of telling participants about *Riley* was qualified by an interaction with whether the participant reported having previously been aware of it.¹²⁴ Though all participants had greater privacy expectations after having been told of the *Riley* decision, this change was greatest when the participant reported no prior knowledge of the case.¹²⁵

Table 3: Electronic Search Expectations Before and After Having Been Told About *Riley*

		Informed About <i>Riley</i>	
		Pre	Post
Expectation	No	2.83 (.03)	3.67 (.03)
	Yes	2.83 (.05)	3.24 (.05)
Warrant	No	0.67 (.01)	0.84 (.01)
	Yes	0.67 (.01)	0.73 (.01)

Numbers are means (std. errors in parentheses).

These results provide something of a cautionary tale for the measurement of circularity in Fourth Amendment attitudes. As we saw above, only a small subset of people actually changed their expectations in the wake of the *Riley* decision, and this change in their expectations was short-lived. But this alternative method of assessing circularity, telling people what the Supreme Court said and then immediately asking them about the subject, yields a very different answer. Since the question of circularity is motivated by a concern that general public surveys of privacy attitudes will be confounded by Supreme Court decisions, it is the former

¹²³ Expectation: $F(1, 3421) = 438.33, p < .001 \eta^2 = .114$.

Warrant: $F(1, 3421) = 167.75, p < .001 \eta^2 = .047$.

¹²⁴ Expectation: $F(1, 3421) = 52.13, p < .001 \eta^2 = .015$. Warrant: $F(1, 3421) = 37.43, p < .001 \eta^2 = .011$.

¹²⁵ The means in the “pre” column are identical across knowledge conditions. Recall that knowledge of *Riley* was not associated with greater privacy expectations in Waves III and IV; it was actually non-significantly in the other direction. Since this analysis collapses across waves, the positive relationship between *Riley*-knowledge and privacy expectations in Wave II gets washed out by the other two waves.

method, which does not beat participants over the head with the Supreme Court's reasoning, that is appropriate.

E. Comparison to Another Domain: Hobby Lobby

A very prominent case involving the Affordable Care Act's contraception mandate, *Burwell v. Hobby Lobby Stores*,¹²⁶ was decided June 30, 2014, five days after *Riley* and one day before Wave II. Since Waves I and II were going to bracket that case as well as *Riley*, we also asked about it in each of our survey waves. The response to this case underscores the relatively modest effect that the Supreme Court sometimes has on public attitudes, and also highlights differences across legal domains. We explained the question at stake in *Hobby Lobby* like this:

Federal law requires large employers to offer health insurance coverage to their full-time workers. By law, employer-sponsored health insurance plans must cover the costs of certain medical procedures for any employees who wish to obtain them. A separate federal law, the Religious Freedom Restoration Act, prevents the government from imposing substantial burdens on the sincere exercise of religious rights without a compelling justification.

Imagine the owners of a family-owned, for-profit business with 13,000 employees sincerely object on religious grounds to providing one of the following medical procedures as part of the company's health insurance plan.

The described company is modeled after Hobby Lobby itself. After this prompt, participants were asked whether such a company should be able to exclude from its healthcare plan coverage for three different medical services: abortion, birth control, and flu shots. For each service, participants responded on a 5-point scale that ranged from "Definitely Not" (1) to "Definitely Yes," (5) with a midpoint of 3. The three different types treatment were included to assess whether any effect found on the one immediately at issue in the case, birth control, would generalize to others. In *Hobby Lobby*, the Supreme Court held that a for-profit company could invoke the Religious Freedom Restoration Act's protections to resist a mandate that its health insurance plan cover contraceptives.

¹²⁶ 134 S. Ct. 2751 (2014).

Table 4: Responses to the *Hobby Lobby* Questions

	Wave I	Wave II	Wave III	Wave IV
Abortion	2.97 (.06)	3.11 (.06)	3.13 (.04)	3.01 (.05)
Birth Control	2.62 _{ab} (.06)	2.77 _b (.06)	2.75 _b (.04)	2.60 _a (.05)
Flu Shot	2.30 (.06)	2.23 (.06)	2.35 (.04)	2.26 (.04)

Numbers are means (std. errors in parentheses). If a measure differs significantly across condition, scores on that measure that do not share a subscript are significantly different from each other.

The same type of ANCOVA that was employed to measure cross wave differences on the *Riley* questions was also used here. There were no significant differences across waves for the abortion and flu shot questions, and, as can be seen in Table 4, the differences that were observed on the birth control question were small and hard to interpret.¹²⁷ An inspection of the means suggests that the public's understanding of the law moved in the direction of the Court's decision between Waves I and II, the immediate before and after waves, and then moved back to its initial level of support for religious exceptions in Wave IV. But the change between Waves I and II is nonsignificant, and the only significant difference is between Wave IV and the two waves that immediately preceded it.

Unlike in the *Riley* case, here we do not have a significant attitudinal move in the direction of the decision the Supreme Court reached.¹²⁸ There could be any number of reasons for this. Perhaps the public had stronger and more divided initial opinions in *Hobby Lobby*; it was, after all, a 5–4 decision. Or perhaps something in our description of the issue polarized respondents. We return to the possibility of polarization in the conclusion.

Two patterns from *Riley* do hold, however, as seen in Table 5. First, those in Waves II–IV who reported having heard of the decision were more likely to support the Court's outcome in favor of the employer. Unlike last time, however, there is no interaction here between knowledge and study wave; the size of the knowledge effect does not differ across waves. Second, after participants were told of the Court's holding (here, as with

¹²⁷ Abortion, $F(3, 4118) = 2.24, p = .08 \eta^2 = .002$.

Birth Control, $F(3, 4118) = 3.05, p < .05 \eta^2 = .002$.

Flu Shot, $F(3, 4118) = 1.23, p = .30 \eta^2 = .001$.

¹²⁸ This response replicates what Huq and Mentovich found in a longitudinal study of *Hobby Lobby* conducted on *Mechanical Turk*. See Huq & Mentovich, *supra* note 66, at 40.

Riley we readministered the main dependent measures after telling participants of the holding) they shifted substantially in the direction of it.

Table 5: Effect of *Hobby Lobby* Knowledge on Post-Decision Views

	Prior Knowledge of <i>Hobby Lobby</i>				df	F	η ²
	Yes		No				
Abortion	3.19	(.04)	2.96	(.04)	1, 3415	12.73 ***	.004
Birth Control	2.79	(.04)	2.60	(.04)	1, 3415	10.57 **	.003
Flu Shot	2.32	(.04)	2.23	(.04)	1, 3415	2.76 +	.001

	Informed About <i>Hobby Lobby</i> in Study				df	F	η ²
	Pre		Post				
Abortion	3.07	(.03)	3.29	(.03)	1, 3420	50.73 ***	.015
Birth Control	2.70	(.03)	3.13	(.03)	1, 3420	178.85 ***	.050
Flu Shot	2.28	(.03)	2.66	(.03)	1, 3420	169.41 ***	.047

Numbers are means (std. errors in parentheses).

One other revealing note regarding this data is that more people reported having heard of *Hobby Lobby* than of *Riley*: 65% in Wave II, and 46% and 42% in Waves III and IV respectively. This makes a substantial amount of sense; *Hobby Lobby* was the main Affordable Care Act case of its term and it addressed high political salience questions regarding reproductive rights and freedom of religion.

IV.) IMPLICATIONS AND LIMITATIONS

The attitudinal circularity hypothesis has been articulated so often and so widely as to make it almost axiomatic among lawyers and scholars who work on Fourth Amendment doctrine. Yet it remained untested. Our study of the popular response to *Riley* presented a golden opportunity to finally see how actual people reacted to a major change in privacy law. Fourth Amendment cases are rarely front-page news, rarely concern a topic that is both salient and readily comprehensible to laypeople, and are rarely unified. In *Riley v. California* the stars were perfectly aligned: the news was on the front page, smartphones are ubiquitous, and the Court was unanimous. And, even under these favorable conditions, the attitudinal circularity hypothesis failed with flying colors.

Based on our data, the most that can be said on behalf of the attitudinal

circularity hypothesis is when the Supreme Court speaks prominently and unanimously in a manner that expands privacy rights, that expansion will be noticed by a minority of the public a week after the decision. Once a year, or two, has passed, the effect of the decision on popular expectations will have disappeared entirely. And decisions like *Riley* that involve one form of electronic surveillance do not have even short-term effects on popular attitudes about other forms. Recall that scholars have taken a broad view of the significance of *Riley* whereas the public's expectations about related searches did not change in response to it. Any attitudinal circularity that exists in Fourth Amendment law is short-lived and limited, even with respect to high-profile, surprising, and unanimous decisions like *Riley*.

The absence of any long-term attitudinal circularity significantly buttresses the case for approaches to *Katz* that include public sentiment as a relevant or even decisive factor in determining whether a reasonable expectation of privacy exists. Popular beliefs about police surveillance seem to be very stable, and this stability makes them a potentially useful source of data for judges seeking to benefit from the wisdom of the crowds.

In addition to refuting a widely-held belief in legal circles, our study also contributes to the political science literature on how the public responds to Supreme Court decisions. Recall the recent emergence of an important hypothesis in political science – the thermostatic model – which posits that when the Supreme Court moves in one direction, public opinion will immediately shift in the other direction, but then gradually follow the Court over the long run.¹²⁹ Our data indicate precisely the opposite dynamic, at least in this particular context. Our data are also in significant tension with the older legitimacy theory of popular response to Supreme Court decisions.¹³⁰ If anything, the data seem consistent with research suggesting that the Supreme Court's decisions do little to influence popular opinion over the long run.¹³¹

One theory that we cannot address with our *Riley* data is the structural response model. None of the personality or demographic measures sampled in Wave I predicted both initial expectations and perceived warrant requirements.¹³² We therefore cannot neatly divide our sample into groups

¹²⁹ See *supra* text accompanying notes 69-70.

¹³⁰ See *supra* text accompanying notes 47-52.

¹³¹ See, e.g., THOMAS R. MARSHALL, PUBLIC OPINION AND THE SUPREME COURT (1989); Johnson & Martin, *supra* note 67, at 306-07; Gerald N. Rosenberg, Book Review, *The Wonder of It All*, 45 TULSA L. REV. 679, 686-87 (2009).

¹³² One personality measure, Rightwing Authoritarianism, predicted warrant

prone to support and oppose the decision and compare the reactions of those groups once the decision was published. Our *Hobby Lobby* data, however, do allow for that kind of analysis. Though most demographics were entirely irrelevant to views on the critical issue – support for the birth control exemption – overall liberalism or conservatism was highly predictive in Wave I. A regression analysis then showed that the effect of political orientation became stronger in Wave II, meaning that liberals and conservatives differed more in Wave II than they did in Wave I. In Wave III the difference returned to baseline before it actually reversed slightly in Wave IV. The principal result here is displayed in Figure 3 with liberal and conservative being estimated at the scale endpoints. Note the spreading of the liberal and conservative lines in the immediate post-decision data collection and then the gradual return to initial attitudes. The full regression analysis is reported in the Appendix.

Figure 3: Support for a Birth Control Exemption Across Waves

Our data from both *Riley* and *Hobby Lobby* most neatly support a narrative based on the Elaboration Likelihood Model of persuasion.¹³³ In the case of *Riley*, some portion of the population hears of the outcome immediately after the decision and, based on a general liking and respect for the Court, changes its view. But this persuasion is based on a peripheral cue, liking for the source, and is not deeply processed or understood. This

perceived warrant requirements but not the expectations measures.

¹³³ See *supra* text accompanying notes 43–46.

explains both why the population does not generalize from the specific holding to other searches – they aren’t thinking enough about the subject to see the connections that are so obvious to experts – and also why the persuasion is so fleeting. Our findings on *Hobby Lobby* actually point in the same direction. Though we observe an initial effect that is consistent with the structural response model, that effect fades quickly. Again, this shows a fundamentally shallow and limited effect, likely a function of shallow and limited processing of the decision. Though Hoekstra’s ELM-based theorizing ultimately produced mixed results,¹³⁴ our data suggest it may be a fruitful model for future exploration.

More important than our contribution to a general understanding of the effects of Supreme Court decisions is our ability to weigh in on a domain where the legal doctrine directly incorporates popular beliefs. As a doctrinal matter, the beliefs of voters about the First Amendment or gun rights or separation of powers are irrelevant; the Supreme Court can be and often is counter-majoritarian. The relevance of public attitudes, if any, would be indirect and derive from a legal realist conception that the Supreme Court often follows public opinion.¹³⁵ But in a couple domains of constitutional law – search and seizure law as well as capital punishment, and maybe gay rights – the Supreme Court has made popular beliefs doctrinally relevant, or even decisive.¹³⁶ *Riley* is therefore the rare case where popular beliefs about what the law is can be directly relevant to the legal question before the Court. And here we have a clear result: the influence of a Fourth

¹³⁴ See HOEKSTRA, *supra* note 53, at 112-14. Recall that the data in two of her cases saw a shift in the Court’s direction and two did not. She had actually made a more complicated prediction – that the shift would occur in communities *neighboring* those immediately involved because they would be exposed to the decision in popular coverage but not have the self-interest motivations of the communities immediately involved – but that was not supported.

¹³⁵ See generally ROBERT G. MCCLOSKEY, *THE AMERICAN SUPREME COURT* 260 (5th ed. 2010) (revised by Sanford Levinson) (“[I]t is hard to find a single historical instance when the Court has stood firm for very long against a really clear wave of public demand.”).

¹³⁶ See, e.g., *Bond v. United States*, 529 U.S. 334, 338-39 (2000) (deciding that squeezing a bus passenger’s bag is a Fourth Amendment search based on the expectations that an ordinary passenger would have); *Roper v. Simmons*, 543 U.S. 551, 564-68 (2005) (striking down the juvenile death penalty under the Eighth Amendment’s “evolving standards of decency” test); *Obergefell v. Hodges*, 135 S. Ct. 2584, 2603 (2015) (noting the relevance under the Equal Protection Clause of “new insights and understandings [that] can reveal unjustified inequality within our most fundamental institutions that once passed unnoticed and unchallenged”).

Amendment Supreme Court decision on public attitudes is minimal.

That said, our study still leaves some questions unresolved. When the Supreme Court articulated the hypothesis of attitudinal circularity in *Smith v. Maryland* it did so against a backdrop of a government pronouncement that existing privacy rights had been erased.¹³⁷ In *Riley* a substantial change in privacy law occurred, but in the opposite direction. The Supreme Court told the public that they had greater privacy rights in their cell phones than previous judicial pronouncements had indicated. It is possible that the popular response to Fourth Amendment decisions is asymmetric, such that a different dynamic emerges when the government decreases privacy protections instead of increasing them. Were the Supreme Court to grant certiorari in a decision that gave it grounds to overrule *Katz* or *Riley*, there would be an opportunity to look for such asymmetries.¹³⁸ Similarly, we could look for such an asymmetry if the executive announced a new restriction on privacy rights. Until such an opportunity to test the effects of

¹³⁷ See *supra* text accompanying note 10.

¹³⁸ The Supreme Court does not diminish privacy expectations very often in highly salient cases, but *Olmstead v. United States*, 277 U.S. 438 (1928), was a famous example of them arguably pegging legal expectations of privacy below extant popular expectations of privacy. The wiretapping that federal agents conducted in *Olmstead* was a violation of the laws of Washington state, where *Olmstead* resided and did business. *Id.* at 468-69. For that reason, the legally sophisticated *Olmstead* believed that even though the government could be wiretapping his calls, evidence gleaned from those calls could not be used to prosecute him. See DANIEL J. SOLOVE & PAUL M. SCHWARTZ, INFORMATION PRIVACY LAW 272 (5th ed. 2015). Dissenting in *Olmstead*, Justice Holmes noted that in his view the Fourth Amendment prohibited the federal government's introduction of evidence that was gathered in violation of state law. *Olmstead*, 277 U.S. at 469-70 (Holmes, J., dissenting). Arguably, *Smith v. Maryland*, 442 U.S. 735 (1979), which held that the police do not need a warrant to install a pen registry that tracks all the numbers dialed by a telephone customer, and *California v. Greenwood*, 486 U.S. 35 (1988), which held that the police do not need a warrant to search the trash left outside people's homes, were other salient examples of the same phenomenon. Even several years after *Greenwood* was decided, Slobogin and Schumacher found that survey respondents continued to regard the police search of the garbage outside someone's home as moderately intrusive. Slobogin & Schumacher, *supra* note 4, at 738 tbl. 1. Other cases where the Court's result would have plausibly surprised most Americans concern issues that we suspect were not particularly salient to the average person. See, e.g., *Florida v. Riley*, 488 U.S. 445 (1989) (no expectation of privacy against aerial surveillance of a greenhouse on private property), *United States v. White*, 401 U.S. 745 (1971) (no expectation of privacy against the recording of a conversation with an undercover informant).

a reverse-*Riley* decision arises, however, our best assumption is that the public would respond to privacy-diminishing decisions in much the same way it responds to privacy-enhancing decisions.

The evidence we report here provides support for neither the weak version (slow moving shifts in expectations) nor strong version (prompt shifts in expectations) of the attitudinal circularity hypothesis. That said, our study provides a better test of the strong version of circularity. We feel that by studying the effects of a landmark ruling one week, one year, and two years after the decision we have given circularity a fair shake. We picked up the immediate effect, such as it was, and then gave the effect time to either magnify, as word spread, or dissipate, as memories faded. Admittedly, it is possible that the lasting effects of *Riley* on the public's expectations will emerge after five years, or ten, or twenty. We will continue to insert the questions we have posed here into nationally representative surveys in the coming years, and if a shift occurs, we will write about it. That said, the greater the temporal distance between a decision and a survey, the harder it is to conclude that any shifts in popular beliefs can be traced to the decision (or implementations of the decision) as opposed to other confounding factors. People who insist that the effects of a Supreme Court decision on popular expectations will emerge only after a decade or two are articulating a non-falsifiable hypothesis.

Even if circularity operates on a generational timescale, it would be wise to ask whether this dynamic gives rise to the original problem that concerned circularity proponents. Privacy expectations must come from *somewhere*. Presumably they are a product of, among other factors, cultural norms, technological capabilities, and political policies. If expectations update over time to reflect changing realities, this is to the public's credit. As we explained in Part I, circularity becomes a problem only if expectations update quickly enough that it becomes incoherent to ask government actors to consider what the public thinks. The data presented here go a long way toward showing that public beliefs are more stable than that caricature assumes.

Our refutation of the attitudinal circularity hypothesis is not perfect, but we think our evidence are as convincing as any data are likely to get for the foreseeable future. To the extent that the law pays attention to empirical reality, the burden of proof has now shifted to those seeking to demonstrate that Fourth Amendment circularity is genuine.

CONCLUSION

Though privacy expectations can change somewhat immediately after a major Fourth Amendment decision, the change is concentrated among those who have explicit knowledge of the Supreme Court decision. Over time, this explicit knowledge appears to be forgotten, and expectations return to baseline. Therefore the Supreme Court would not be “talking to itself” if it incorporated public expectations into its doctrinal analysis; privacy expectations appear to operate largely independently of changes in Supreme Court doctrine. Though the idea of reasonable expectations of privacy’s circularity is widely repeated among scholars and even the justices themselves, the first reliable empirical evidence indicates that, at best, the phenomenon is very short-lived. In the medium-term, Fourth Amendment circularity is a myth.

APPENDIX

Sample Demographics:

In the first three waves, close attention was paid to age, ethnicity, and sex. Following the census convention, “Hispanic” was asked separate from the racial categories and “Sex” required a binary answer. In Wave IV, the sample was also carefully matched on educational attainment and regional representation. This made it important to control for education in cross-wave comparisons; though more carefully matching the census on educational attainment was desirable, it did lead to an inconsistency across time periods. Though there are some other minor variations in representation across waves, only educational attainment shows a major shift.

		Wave			
		I	II	III	IV
% Female		51.71	51.06	50.18	52.55
Age (years)	Median	46	52	47	46
	Mean	46.28 (16.74)	50.48 (16.57)	46.30 (16.42)	46.18 (16.94)
Political Orientation ¹³⁹	Economic	4.15 (1.67)	4.30 (1.77)	4.32 (1.78)	4.29 (1.72)
	Social	3.83 (1.76)	3.96 (1.85)	4.07 (1.92)	4.08 (1.81)
	Overall	3.98 (1.64)	4.12 (1.70)	4.19 (1.79)	4.20 (1.69)
Race/Ethnicity	White	81.14	79.92	79.63	79.21
	Black or AA	9.86	13.16	13.30	11.82
	Indian or Native	1.86	1.46	2.00	2.40
	SE Asian	4.57	4.52	4.15	2.86
	Hawaiian/Pacific	1.00	0.40	0.57	0.31
	Hispanic	16.71	16.76	17.08	17.16
Education	Less than HS	2.00	1.20	2.00	10.97
	HS Diploma/GED	30.57	34.04	34.31	32.61
	2 Year College	25.57	21.28	23.30	29.13
	4 Year College	28.14	29.12	28.02	18.08
	Graduate Degree	13.71	14.36	12.37	9.20
Know <i>Riley</i>		-	40.29	21.09	22.41
N		700	751	1399	1294

For age and political orientation, the numbers in parentheses represent standard deviations.

¹³⁹ Measured on seven point scales ranging from 1 Very Liberal to 7 Very Conservative.

Hobby Lobby Regression

A regression analysis was conducted of the Wave I data to determine whether any demographic or attitudinal factor sufficiently predicted views of the birth control exemption to allow for the kind of analysis required to test the structural response model. As can be seen in Table A1 below, the measure of political orientation had the strongest predictive power in Wave I.

Table A1: Predictions of support in Wave I for the birth control exemption as a function of demographic and attitudinal variables.

	Unstandardized Coefficients		Standardized Coefficients	t	
	B	Std. Error	Beta		
(Constant)	2.297	.142		16.138	
Political Orientation	.357	.014	.378	25.405	***
Sex	-.310	.048	-.095	-6.517	***
Age	-.001	.001	-.009	-.590	
Black	.189	.072	.038	2.645	**
Hispanic	.124	.063	.029	1.962	*
Education	.096	.022	.066	4.428	***
Authoritarianism	.041	.026	.024	1.581	
SC Knowledge	.095	.075	.019	1.255	

A further regression was therefore conducted to examine whether the effect of political orientation changed across wave, as the structural response model predicted using the demographic factors controls. As can be seen in the next Table, the main effect of political orientation was qualified by interactions in the second and fourth waves, indicating that the effect was larger in Wave II and smaller in Wave IV. Political orientation was centered at 0 before this analysis was conducted, so it ranged from -3 to +3.

Table A2: Predictions of Support for the Birth Control Exemption as a Function of Political Orientation and its Interactions by Wave.

	Unstandardized Coefficients		Standardized Coefficients	t
	B	Std. Error	Beta	
(Constant)	2.488	.117		21.320
Political Orientation	.374	.034	.395	10.942 ***
Wave2	.109	.078	.026	1.399
Wave3	.054	.069	.016	.789
Wave4	-.079	.070	-.023	-1.123
Wave2 by Political Orientation	.105	.047	.047	2.245 *
Wave3 by Political Orientation	.001	.041	.001	.035
Wave4 by Political Orientation	-.100	.042	-.058	-2.382 *
Sex	-.301	.047	-.093	-6.406 ***
Age	-.001	.001	-.006	-.379
Black	.189	.071	.038	2.647 **
Hispanic	.110	.063	.025	1.746
Education	.088	.021	.060	4.132 ***

To generate means for the figure presented in the paper, the value of the demographic variables was estimated at their means and the values for Liberal, Moderate, and Conservative were estimated at -3, 0 and +3 respectively. This produced the following set of values.

Table A3: Estimates of Support for Birth Control Exemption by Wave and Political Orientation.

		Liberal	Moderate	Conservative
Wave	I	1.50	2.62	3.74
	II	1.29	2.73	4.17
	III	1.55	2.67	3.80
	IV	1.72	2.54	3.36

Questionnaire Items

1. Full list of searches:
 - Physical searches
 - Search his car for any packages he might be carrying and open the packages.
 - Open his briefcase or backpack to check whether it contains drugs.
 - Fingerprint him.
 - Open his backpack, find his diary, and read the diary to see if it contains anything incriminating.
 - Take a DNA sample using a mouth swab.
 - Take a blood sample.
 - Strip search him.
 - Perform a body cavity search on him.
 - Electronic searches
 - Power on the phone and see what the start-up screen displays.
 - Turn off the phone to prevent its contents from being encrypted or deleted
 - Search the phone for a list of most recent calls.
 - Search the phone for the 10 most recent text messages.
 - Search the entire text message history.
 - Search the phone's browser for a list of recent Google searches.
 - Use the phone to access his email account and read his emails.
 - Use the phone to open his Facebook app and read his newsfeed and messages.
 - Subject the phone to a forensic examination to recover any pictures, documents, and emails that the arrestee may have deleted.

2. GPS tracking questions:
